During the Middle Ages Finland's cities and ecclesiastical buildings were conceived in the tradition of the brick buildings that had been introduced to the Baltic by the Teutonic knights and the religious orders, particularly the Franciscans and the Dominicans. The fortresses and castle buildings built for the Swedish crown were erected from Viborg in the west to Kajaneborg in the north. Finland's most important city was Åbo at Aura, and its castle and cathedral exemplify fortifications and church architectural traditions from the Gothic and High Gothic periods.

Brick was a prerequisite for the system of vaults and the large areas of wall which gave rise to a tradition of rich painting. This developed during the 14th century and was most widespread in the second half of the 15th and the beginning of the 16th centuries, especially in the rich coastal areas and on Åland, the group of islands situated towards Sweden. Much of this late medieval church architecture with painted vaults and walls, as well as sculpted triptychs, crucifixes and saints' images, is of a high artistic level, on a par with work produced

in the rest of Scandinavia and the area around the Baltic. However, nothing distinctively Finnish can be distinguished, except in provincial works.

In country churches, brick was used mainly for gable finials, vaults, portals and window frames, but the dominant building material was granite, as in Sweden. During the Middle Ages, wooden churches were erected in the northern and inner areas of the country, but became common only after the Reformation. After Finland's conversion from a Catholic to a Protestant country, work on church architecture and contacts with Western European cultural centres all but ceased. During the 16th century secular architecture increased. Duke Johan III, Erik XIV of Sweden's half-brother, had some parts of Åbo Castle enlarged and decorated. However, almost no buildings or decoration from this period have survived, and it was not until the 17th century that a vigorous and internationally-minded upper class began to commission significant works. The upper echelons of the aristocracy, represented by families such as the Flemings, Horns, and Creutzers, built large stone manor houses along Dutch Palladian lines in the same style as those in Sweden. The best preserved is the one at Villnäs some miles north of Åbo. This is a rectangular stone house with white plastered walls and a high pitched roof, whose original interiors of the 1650s and 1660s have been remarkably well preserved. This kind of manor house was developed by the architects Jean De la Vallée and Nicodemus Tessin the Elder as a Swedish adaptation of Dutch and other versions of Andrea Palladio's 16th-century villas.

Prior to the more French-influenced Baroque period at the end of the 17th century, the dominant requirement in interiors was for a rich Renaissance style of painted beamed ceilings. The decoration at Villnäs consists of landscapes, flowers, animals and ornament whose motifs were taken from the period's numerous and widely circulated pattern books.

Usually the wooden ceilings and plastered walls of the large manor houses were decorated by official painters trained in the cities. The lower part of the walls might be painted as hanging draperies or as panel-like ornament. Consoles were often painted in perspective beneath the ceiling mouldings. The stucco decoration which is preserved in many manor houses and town palaces in Sweden is frequently missing in the few buildings which have survived in Finland. This is mainly due to the long periods of war prior to the peace of 1721, when large numbers of property-owners fled to Sweden.

Important iron and timber industries developed in the 18th century, especially in coastal areas, where they flourished alongside local shipbuilding yards and the trade in tar and wooden goods. This in turn led to a great increase in the merchant and banking classes, and from the middle of the century the rapid economic expansion of the principal trading cities encouraged the development of a native domestic architecture in timber and stone which soon spread to other levels of society. The significance of these cities for the growth and character of rural architecture, interior decoration and furniture was considerable and numerous journeyman painters and decorators found employment in them.

During the Rococo and Gustavian period, a French-influenced taste for painted wall panels and over-doors, glazed tiled stoves and painted furniture spread to the richer coastal areas, via Stockholm. Within inland Finland, where a Finnish-speak-

ing peasant population lacked the money for such luxuries, timbered houses remained simple, with the exterior and interior walls left bare to reveal the naturally greying wood.

Throughout the entire period that Finland was a part of the Swedish kingdom, architects were recruited from Stockholm to build the more magnificent houses, but the building of Sveaborg (Suomenlinna), the large fortress outside Helsinki, provided opportunities for indigenous architects to train in architecture. Built as both a deterrent and as a safeguard against a possible Russian invasion, Sveaborg was the Swedish nation's largest building project of the 18th century. The engineers and experts in fortifications who worked there were also trained in architecture, and as stone masons, cabinet-makers and decorators, and the influence of this training contributed greatly to the French-inspired Rococo classicism within Finnish architecture for many years to come.

The manor house at the Fagervik Iron Mill, dating from the 1770s, and Svartå Manor House are the foremost surviving examples of this type of architecture, and their interiors follow the taste that had been created at the Stockholm Royal Palace. This was in turn spread by the Superintendent's Office of Works, the state administration which supervised all public building projects, such as town halls and churches.

Many of Finland's manor houses, such as those at Kankas, Fagervik and Svartå, include faience tiled stoves ordered from Marieberg or Rörstrand. During the second half of the 18th century painted ceilings disappeared completely and were replaced by smoothly plastered fire-proof ceilings, wainscoting, and linen wall panels painted to resemble coffered panels, landscape views or textiles. From the 1780s, Neo-Classical subjects such as painted columns, sculptures in niches, or marbled and stencil painting became increasingly evident. But, on the whole, in comparison to Sweden, there were relatively few large commissions for interiors. Svartå, with its castle-like main building constructed in panelled log timbers, is the most magnificent domestic building of the Swedish period; its luxurious and costly interiors illustrate its owner's wealth and social ambitions.

Until the 19th century most Finnish cities were almost entirely constructed in wood, with red or yellow painted panelled façades, but a number of plastered masonry houses with broken mansard roofs were also built, particularly in Åbo and Helsinki. These had ordinary Rococo interiors with doors, *boiseries* and other features taken from French models such as J.-F. Blondel, Briseux, or after the Swedish architectural book "Forty Domestic Buildings in Stone and Wood", published in 1755.

Finland's break away from Sweden occurred while Neo-Classicism's largest building project was in progress. This was the Åbo (Turku) Academy, a magnificent university building which was begun in the first years of the 19th century by the architect Carl Christopher Gjörwell, later to become city architect and professor in Stockholm. After 1809 the Academy was completed with the assistance of the ruling Russian Tsar, Alexander I, but the building burnt down by the 1820s. After a few years as Louis-Jean Desprez's collaborator, Gjörwell succeeded in creating one of the period's most monumental structures, in which the marble-clad entrance hall and the basilica-like banqueting room in particular mirrored Greek or Roman interiors.

Scandinavia: library, Suur-Merijoki, near Viborg, Finland, by Eliel Saarinen, 1903; watercolour

Gjörwell's other unsurpassed Finnish interiors were those for Count Mauritz Armfelt's library at Åminne Manor House, created in the 1810s, which had specially designed tables, chairs and sofas, as well as mahogany bookcases with gilded sculpted decoration wholly comparable with Percier and Fontaine's interiors in Paris of the same period. According to tradition, the library interior impressed Alexander I so much that he decided to have a copy made at his palace at Tsarskoe Selo.

The architect chosen in 1816 to transform the new capital Helsinki was Carl Ludwig Engel, who was trained in Berlin. Clearly sensitive to the monumental, he received the unique commission to design and build the new city centre, with university and senate buildings as wings around a square, with a church at its centre. The architecture follows antique and Renaissance prototypes, but the interiors principally reflect contemporary Russian tastes from St. Petersburg.

Although Engel's Empire style has little that is distinctively Finnish about it, and, in fact, is one of the most perfect examples of international Neo-Classicism, it can still be understood today as an important part of the national expression. Helsinki and its Empire buildings, together with those in St. Petersburg, were the most complete examples of Neo-Classicism in Scandinavia. Engel's elegance as an architect is most apparent in the University Library near Senatsplatsen, where a modern

function has been combined with a classical ideal in the top-lighting from semi-circular windows. The most expensive wood – mahogany – is combined with ornament in gilt bronze or lead on the doors, and with classical architraves in stone colours.

The international influence on Finnish architecture and interiors continued until the 1880s, when moves towards political and cultural liberation speeded up in reaction to the growing severity of the Russian administration. The threat of complete assimilation with Russia emerged in the 1890s, but the period was also a time of tremendous growth for architecture, design and art. The main sources of inspiration came from European and American Art Nouveau and Modernism, and from the study of Finnish culture which became increasingly important. The Finnish architects Herman Gesellius, Armas Lindgren and Eliel Saarinen studied the bold, new iron structures of American skyscrapers and the progressive ideas and designs promulgated in the English periodical *The Studio*. They formed an associated architectural practice with adjoining homes in Hvitträsk, northwest of Helsinki, and created a highly charged and romantic artistic vision which fused elements of Finnish history and tradition with the most modern ideas. Through the examination of medieval churches and stone fortresses, and the study of traditional Kerelen and Finnish rough log buildings, they created a synthesis that was

Scandinavia: Scroll Chair by Alvar Aalto, 1934

forward-looking and new: an international villa ideal which took advantage of the terrain's distinctiveness, eschewed symmetry and used basic materials such as tar shavings.

Many Finnish artists and architects at the turn of the 20th century were strongly influenced by John Ruskin's plea for the return of craftsmanship. To some extent, the collective practice shared by Gesellius, Lindgren and Saarinen, which encompassed the design of public and private housing, villas and manor houses, and their furniture and fittings, parallels C.R. Ashbee's Guild of Handicraft. The English models are particularly clear in country houses such as the main building at the Träskända property in Esbo near Helsinki. Combining Italian Renaissance and English Arts and Crafts influences, the three architects were able to forge a new Finnish style of interior characterised by panelled walls, brick or tiled fireplaces, and built-in sofas and bookcases, before their practice disbanded in 1907. A more German inspiration can be detected in their town houses for well-to-do Helsinki patrons. The exterior of the Fler family house in Helsinki, with its gables and tower-like projections, is similar to a medieval building, but the interior is more like an English villa taken straight from the pages of *The Studio*. A sense of "home" was emphasised, as was the craftsmanlike quality of everything from doors, windows, and banisters to electric fittings. Stonemasons and painters worked together on a project whose unity and collaborative spirit was very much in keeping with the tenor of the times.

The most colourful and influential innovator in Finland around 1900 was Axel Gallén, later called Gallen-Kallela. Through his multi-faceted talents and commitment he was involved in virtually every sphere of Finnish national culture. As co-publisher of the periodical *Ateneum*, he publicized all his own interiors and projects for furniture, domestic utensils and decoration. These included the Kallela house, which was designed in a rustic style with exposed timber walls, simple sculpted furniture and artistically consistent details, such as inner and outer doors with medieval-looking ironwork decoration. Every detail was conceived as a work of art, and the whole was designed in Gallen-Kallela's unique *Kalevala* style. As in his fresco painting, the symbolic is always clearly visible.

At around the same time, the desire to provide better housing for a wider group of people was taking shape in Finland. This led, for instance, to the production of architecturally designed furniture at the Iris factory in Porvoo (Borgå) for which the Belgian ceramist A.W. Finch (1854–1930), among others, made designs in a Cubist-Art Nouveau style.

The painter Louis Sparre, who also designed furniture for the Iris factories, was another committed spokesman for the spread of new trends in home decoration in Finland where the writings of Carl Larsson, Anders Zorn and Ellen Key were becoming quite significant. Like them, Sparre involved himself in the design of a project for an artist's home which was published in the *Ateneum* in 1901. Lightness and airiness, and the rejection of printed patterns in favour of an emphasis on the architectonic shapes of fixed seating groups, are characteristic of this period and the following decades. But the foundations for the breakthrough of Functionalist ideas and aesthetics had already been laid by the turn of the century, and with his Berghäll Church in Helsinki, dating from 1908, the architect Lars Sonck (1870–1956) was one of its new creators.

After Finland's liberation from Russia in 1917 many monumental buildings were given a more retardaire classical look, both externally and internally. But the country also nurtured one of the foremost exponents of Functionalism, the architect and furniture designer Alvar Aalto. For much of the 19th century, the influence of Germany had been paramount, but from the turn of the century this was overtaken by the interest in America. Aalto's architecture and laminated wood furniture of the 1930s combined a Modernist emphasis on rectilinearity and function with industrial methods of production. In the United States these methods had already been patented in the 1870s by manufacturers of bentwood and pressed furniture. Aalto's role as Finland's leading architect and furniture designer was unrivalled, and the influence of projects such as the library at Viipuri (1933) and the Finlandia Hall in Helsinki (1962–75) can still be felt.

The architect Eero Saarinen, also active in America, is one of Finland's foremost furniture designers. His works share many qualities with those of his American colleague Charles Eames: both designers explored moulded synthetic materials, using moulded plywood on steel frames as the starting point.

Successful furniture designers and architects have followed in Aalto's and Saarinen's footsteps and Finland's role as one of Scandinavia's leading design countries is reflected in many areas, such as glass, wood, textiles and silver. Tapio Wirkkala (1915–85) was Finland's principal innovator after World War II. His achievements include the organisation of seven Triennale exhibitions in Milan, but he is mainly known as a designer of glass at Iittala glass works. Here Wirkkala followed in Aalto's tradition, for Aalto also designed glass for flower vases for Iittala.

Denmark

Until the middle of the 17th century Denmark was incorporated into the area that now forms part of Sweden, known as Skåne, but from as early as the end of the 15th century a large group of Danish landowning nobility built fortified castles surrounded by moats. One well-preserved example is the Glimminghus in Swedish Skåne, built in 1499 by the nobleman Jens Ulfstand. During the mid-16th century, the aristocracy's

Scandinavia: design for decorative scheme at the Royal Palace, Copenhagen, by Nicolai Abildgaard, 1790s

opportunities to build powerfully fortified castles on Danish islands and in Skåne increased. Hesselagergård on Fyn, and Wittskövle and Torup in Skåne represent surviving instances of 16th-century private castles, often with distemper wall paintings, large fire surrounds, and beamed or coffered ceilings.

At the end of the 16th century Frederick II emerged as an important builder of castles and fortresses. Kronborg Castle at Helsingør (Elsinore) is the most important, and was built and decorated by Netherlandish masons and craftsmen. The circle of immigrant tapestry weavers and foreign sculptors and painters who were employed on this project, and who in turn trained Danish pupils, formed the basis for one of Northern Europe's largest centres of art in Denmark. In 1588 Frederick II was succeeded by his son, Christian IV, who followed in his father's footsteps as a patron of the arts, with further work at Kronborg and at Frederiksborg Castle at Hillerød. Historical paintings were commissioned from Holland; at this time the most important family of architects was the Stenwinckel family. Large monumental buildings were erected in Copenhagen in the period's Netherlandish Renaissance style; these included the Stock Exchange, the Textile House, the Round Tower, and Holmen Church. Until the Thirty Years' War Denmark's position as the only great cultural centre in Scandinavia was unrivalled, as witnessed by commissions such as the Polish artist Adriaen de Vries' bronze sculptures made for the fountain at Frederiksborg Castle, which depicted Christian IV as Neptune. But the advent of war with Germany, and subsequently between Denmark and Sweden, changed this situation dramatically, and, with Skåne's incorporation into

Sweden, the building of new cities such as Kristianstad transmitted high Danish culture into Swedish areas.

From the 1660s Swedish royal power increased, and there followed a long period of autocratic government that lasted until the 18th century. During this time it was principally through royal initiatives that new monuments were created. At the beginning of the 18th century the Swedish architect Nicodemus Tessin the Younger received commissions to design the new royal palaces near Copenhagen.

After the collapse of Swedish autocracy in 1718, Denmark enjoyed a Golden Age. From the 1720s to the 1740s a series of large building projects was begun, and new areas in Copenhagen were planned under the leadership of Frederick V's court architect Niels Eigtved. The artistic sources of inspiration were the 17th- and 18th-century French palace complexes and Parisian town squares.

Nicolas-Henri Jardin was summoned to Denmark in 1755, after training in Paris and spending a further four years in Rome. He had great influence, both through his appointment as professor at the Art Academy in Copenhagen, and through his pupils C.F. Harsdorff and Nicolai Abildgaard. Jardin introduced Rococo Classicism, which developed into the early form of Neo-Classicism known as *le goût grec*. This style drew its inspiration mainly from the excavations in the newly uncovered cities of Pompeii and Herculaneum, which from the 1750s were publicised in a series of engravings, *Le Antichità di Ercolano*. Jardin's commissions in Denmark were closely connected with the project to design an entire city quarter, the so-called Frederiksstaden. This was to have a central church,

the Marmorkirken (Marble Church), streets, and a number of identical palaces around an octagonal square, arranged axially in relation to the new monumental church. The four palaces now form the Danish royal palace, the Amalienborg. Jardin designed both the fixed decoration and the furniture for the Amalienborg in a French Rococo style that expressed an increasing serenity, which was also becoming fashionable in France during this period.

Baroque classicism persisted as the favoured style for banqueting rooms, although today this is interpreted as a resurgence of Neo-Classicism. Jardin's pupils became acquainted with the lessons of the celebrated French classicists Jacques-François Blondel, Jean-François Neufforge and J.-C. Delafosse. His arrival in Denmark marked a turning away from the influence of German Rococo towards French taste, and also the beginning of a thorough-going Neo-Classicism that was further developed by Abildgaard through his study of antique furniture. Yet it was Jardin's pupil Harsdorff who received the commission to create a Danish version of French Neo-Classicism. In his interiors and furniture for the Danish royal palace Harsdorff used the antique's strict architectural elements as decoration, introducing a severity to building and furniture types that had been created during the Rococo period or earlier. Ornaments such as fluting, classical capitals, bases and decorative laurel garlands, rosettes and ribbons are the distinctive features that distinguish Danish Neo-Classicism of the 1770s and 1780s. Like those of the contemporary Swedish furniture designers, J.E. Rehn and C.F. Adelcrantz, these features had their roots in Neufforge and Delafosse, but their distinctively Danish character is unmistakable.

A strong influence on Danish furniture from English designers such as Sheraton and Hepplewhite is particularly evident during the last decade of the 18th century, and especially in the furniture designed by Joseph Christian Lillie for the royal household. Lillie was principally a decorative artist who painted cupboards and other storage furniture, as well as chairs and sofas, with motifs and ornament inspired by antique models. He was much influenced by the Adam brothers whose interpretation of classical art had a significant impact in France and Scandinavia. During the 1780s Sweden and Denmark became more precise in their study of antique prototypes. In Sweden the French architects Louis-Jean Desprez and Louis Masreliez introduced this shift in style. In Denmark it was Abildgaard who was responsible for creating strictly classicising styles in interiors and furniture which differed from those in Sweden in their dependence on a direct study of Greek and Roman models.

The step from representing classical furniture in historical painting to the production of designs for real furniture was taken when Abildgaard received the commission in 1794 to design the new interiors for the Crown Prince and Princess's suites in the Amalienborg. In addition to surviving designs for the interiors, it has been possible to identify furniture executed for these interiors, principally produced by the cabinet-maker Jens Brøttrup.

During the Napoleonic period, Percier and Fontaine's widely disseminated engravings provided the model throughout Europe for a richer and more decorative classical style of furnishing. In Denmark, the destruction resulting from the fire in 1794 at Christiansborg Palace, Copenhagen's only royal

palace, and later the bombardment of Copenhagen by the English in 1801, provided the impetus for a new style of architecture and interior design that was ultimately more significant than Abildgaard's somewhat anonymous progressive mode.

This style was created by the architect C.F. Hansen who had already prepared a project for the new Christiansborg Palace in a monumental Neo-Classical style as early as 1803. Hansen's collaborator was G.F. Hetsch who later completed some of Abildgaard's stricter furniture designs as well as working in a more generalised German and French Empire style, with ornaments taken from K.F. Schinkel and Percier and Fontaine's decorative vocabulary. However, for the greater part of the Danish public, the German Biedermeier style proved most popular.

The fact that the Danish Art Academy also offered training to craftsmen and recognized journeymen's apprentice works greatly helped to raise standards of craftsmanship and improved the taste of the commissioning and buying public. This may also account for the fact that even today within the fields of interior decoration and design Denmark is Scandinavia's most quality-conscious country.

Following Hansen's and Hetsch's period of domination as interior and furniture designers for Christiansborg Palace during the 1810s and 1820s, a period of independent creativity emerged with the work of H.E. Freund. Trained as a smith and later as sculptor, Freund is primarily remembered as a furniture designer and, like Abildgaard, above all for the design of his own home. After a period of foreign study in Italy he was appointed professor of sculpture at the Art Academy in Copenhagen in 1829. There he produced some strikingly new furniture and decoration that was used from 1830 to recreate an Italian ambience in his official residence at Materialgård by the Frederiksholm canal. These interiors were widely admired and much publicized, and their skilful reworking of the Pompeian style proved highly influential. G.C. Hilker, a painting student at the Art Academy, decorated wall panels and doors with Pompeian motifs on strong monochrome grounds.

Although Freund died in 1840, his home and his furniture were to provide a source of inspiration for younger artists for many years to come. Several items of furniture designed for his residence at Materialgård are now at the Frederiksborg Museum: these include a sofa and divan table, different types of *klismos* chairs and tabourettes. The shapes of the *klismos* chairs, in particular, have a boldness not dissimilar from that of 20th-century postwar design. As well as furniture in mahogany and in other woods, Freund also had a set of painted furniture made specially for his family's children, in which the Greek vase-painting silhouettes set off the architecturally simple forms. Even a child's pram is in the shape of a Greco-Roman chariot and was painted by Hilker, following Freund's instructions. Freund also made designs for silver and porcelain: he can perhaps be called Denmark's first modern designer. Freund's successor as professor of sculpture at the Art Academy was H.W. Bissen, who took over his predecessor's official residence at Materialgård, and even allowed Freund's furniture to be copied.

New developments came with the emergence of the architect Gottlieb Bindesbøll as the leading artistic figure. Bindesbøll is most often associated with the creation of the Thorvaldsen Museum in Copenhagen, but he also worked in

Scandinavia: entrance hall of Gerhard Munthe's house near Oslo, 1890s

the Neo-Gothic, Neo-Rococo and Arts and Crafts styles. In 1839 he began work on the erection of the monument to Denmark's greatest artist, the sculptor Bertel Thorvaldsen, in the form of an almost Egyptian building in Copenhagen close to Christiansborg Palace. The interiors of this building, which were intended to provide a framework for Thorvaldsen's own work and his collection of classical sculptures and vases, have been admired internationally ever since for their classical forms and Pompeian or Greek decoration. In Bindesbøll's other works, created towards the middle of the century, he developed a style freed from the classical ideal. This can be viewed as a functional Modernism and is especially clear in his furniture, particularly his storage furniture. The decoration of the Thorvaldsen Museum was completed during the 1840s. These artistically coherent interiors and furnishings have been a source of inspiration for numerous subsequent museum buildings in Scandinavia.

Constantin Hansen, the previously mentioned G.C. Hilker and Jørgen Roed were all painters who also designed interiors, decoration and furniture. While some of their work continued

established traditions, they also created furniture for daily use which has a simplicity which even today can be understood as wholly modern. Different exhibitions during the late 19th and early 20th centuries, such as the Hilker exhibition at the Kunstindustrimuseum in 1905, helped to re-interpret this furniture, which came to be viewed as proto-modern by young architects and designers.

The 1880s were a time of upheaval in many countries, including Denmark. The need for an industrial art museum was frequently expressed, and in 1885 the *Tidsskrift for Kunstindustri* was established. A group of young artists exhibited at the 1888 Scandinavian Exhibition of Industry, Agriculture and Art in Copenhagen, which also included ceramics. Furniture by the elderly Lorenz Frølich was shown at the same time, and his works were noted especially for their painted decoration, which the period's most renowned art historian, Emil Hannover, described as both unfamiliar and typically Danish.

The furniture was modelled on classical prototypes: an interest in the Pompeian style persisted in Denmark in a unique

way, almost as a national style. The emergence of Danish national romanticism as a reaction to the many historicising styles of the 1860s to 1880s gained its foremost exponent in Thorvald Binsedøll (1846–1908), the son of the designer of the Thorvaldsen Museum. From 1885 Thorvald Binsedøll reproduced his father's furniture in the *Tidsskrift for Kunstindustri* and continued to develop this formal repertoire in rather heavier forms. One of his chairs was exhibited at the Exposition Universelle in Paris in 1900.

The later 19th century's most innovative architect was Martin Nyrop who designed the building and interiors for the Town Hall in Copenhagen. Nyrop's furniture and textiles are in a generalised, almost international style.

During the 1920s great changes and innovations occurred again within Danish architecture and interior design. Just before this period the architect P.V. Jensen Klint had stressed the need to study old Danish folk building traditions, which led to the foundation of the institution Bedre Byggeskik. He called for the revival of earlier craftsmanship and skills, as well as a renewal of their aesthetics. Jensen Klint also designed furniture, but it was his son Kaare Klint who was to be the foremost innovator in Danish interior and furniture design. Kaare Klint was born in 1888, and trained as a painter. From 1913 he was active as a furniture designer and from 1924 he was a teacher at the Art Academy's school of furniture. Together with Carl Petersen, in 1913 he produced furniture for the museum in Fåborg, among other places. Following this he lived in Java for two years, where he developed his interest in East Asia's long-lived furniture tradition. It may be that the study of Chinese seating furniture was the starting point for his brand of Modernism. In the 1920s Kaare Klint led the reconstruction of the old Frederiks Hospital in Copenhagen as the Kunstindustrimuseum, synthesising new and old traditions.

For much of the 20th century Denmark has continued to propound a belief in the fundamental role of craftsmanship, a belief expressed most clearly in the overlapping training of architects, interior architects and cabinet-makers. In Sweden, by contrast, there has been more concern with the development of industrial furniture manufacture. And even if there was a similar reaction against historicising classicism in Denmark, Functionalism and the acceptance of the ideas and formal language of German Bauhaus architecture and interior design have never had the same impact as in Sweden.

A new golden age emerged after World War II when Danish design gained an international reputation, especially with names such as Poul Kjaerholm, Kaj Fischer, Magnus Stephensen, Jørgen Gammelgaard, Børge Mogensen and Hans J. Wegner. Wegner's pale furniture, in particular, has combined classical and Asian forms with Modernist ideas and expression.

Norway

Prior to the Reformation Norway had a rich history of church building in the northern Gothic manner, and both Trondheim Cathedral and the choir of Stavanger Cathedral are High Gothic masterpieces of international quality. Alongside this heritage, the building of wooden churches followed the traditions of stave churches, with their complicated timber constructions, often combined with decorative masonry and relief ornament. Norwegian sacred objects displayed the same

artistic tastes as the rest of Western Europe, and there was a flourishing trade in imported triptychs and altar frontals. Numerous copies were made by local artists and artisans who gained their training in the building of larger projects such as cathedrals and urban developments.

The overthrow of the Catholic church and the monasteries in the middle of the 16th century signalled a break with this architectural tradition and led to a radical curtailment of many other artistic activities. The new Protestant message was, to a great extent, iconoclastic and opposed to art and decoration. Work on building projects that had already begun was abandoned, and over the next hundred years architects were almost solely engaged on secular buildings, mainly fortresses and private homes. Ecclesiastical art in these circumstances consisted in the main of pulpits and epitaphs for high-ranking members of the aristocracy or rich merchants.

At the end of the 16th century and in the 17th century the Northern European Renaissance, with its roots in north Germany and Holland, dominated the architecture of the cities and the official Danish administrative building enterprises. In the cities the burghers' houses were usually constructed of wood, and it was only in the recently built Christiania (the present Oslo) that stone houses were built, and these by decree. One surviving example is Councillor Laurits Hansson's home, built in 1626 in red and yellow brick, with a two-storey gable overhanging the street and blind-arch ornamental gables in a straightforward Dutch Renaissance style. A few manor houses in the country have also survived, for instance at Austråt (1654–56) and Rosendal in Hardanger (1661–65). The Renaissance taste persisted during the Baroque period; the most significant features are richly sculpted portals, fire-surrounds in carved stone and painted ceilings. A similar Renaissance style of sculpted and elaborately painted wooden carving is seen in Denmark and in Skåne, Hålland and Blekinge, the area of southern Sweden which remained Danish until the middle of the 17th century. A more authentic Norwegian style can be seen in provincial and rural building traditions where old-fashioned building types and interiors survived from the Middle Ages.

Until the middle of the 19th century Norway had a strong rural culture, and the country's peasant farm-owners occupied an important position as patrons of decorated interiors and furniture. From the beginning of the 17th century until the beginning of the 20th century a Norwegian speciality was the manufacture of iron stoves called *sattugnar*, and of iron fireplaces on several levels. These consisted of cast sheets decorated in relief, whose subjects and decoration mirrored the stylistic developments in fashions from the Renaissance to Neo-Classical periods. Many of the anonymous sculptors who carved the wooden moulds for sections of cast-iron stoves probably worked from engravings and woodcuts, such as the Bible illustrations made by the so-called Fossum Master, active 1630s–50s. The Fritzoe Master was a creator of moulds working in the Baroque period who, like the sculptor Christopher Ridder (d. 1696), was active in eastern Norway. Ridder also carved altarpieces, epitaphs and other church objects as well as making moulds for cast-iron stoves.

During the 18th century Baroque acanthus ornament, which was first used in church interiors on pulpits, altar compositions, epitaphs, ceilings and lecterns, became a

Norwegian folk motif, alongside rose painting. The links between Norwegian and Swedish landscape painting within the rural tradition were strong at this time, especially in Dalarna, Härjedalen and Jämtland in Sweden.

From the end of the 17th century, when inspiration from the sculptural and architectural tradition of the Netherlandish Renaissance was succeeded by the French High Baroque's more decorative and grander composite schemes, acanthus ornament squeezed out the earlier ornamental vocabulary. This is evident mainly in church interiors, although it can also be seen in a number of surviving secular interiors from the beginning of the 18th century. The strength of the impact of acanthus ornament on provincial architecture can best be studied in rural buildings, since those in cities have been renovated more frequently.

Many sculptors and painters working in churches also made furniture, particularly richly decorated cupboards, with panelling and cornices of carved foliage. One sculptor active in the capital Christiania was Torsten Hoff (c.1688–1754), who also carved altarpieces and pulpits and made moulds for cast-stoves for Baaselands ironworks, using acanthus ornament and architectural backgrounds.

In 1757, a mountain seminary called "the world's first technical high-school" was founded in Kongsberg, in the centre of the Norwegian iron industry, where architectural instruction was offered alongside training in moulding and carving. Architecture was also an important subject for the officers studying fortifications and engineering at the Mathematical School founded in Christiania in 1751.

One of the largest architectural and decorative projects of the Rococo period was the construction of Kongsberg Church, 1740–61. The desire for symmetry and regularity is reflected in the arrangement of the pulpit and altar, which are crowned with a gallery and a large organ. The rich decoration, including much marbled and gilded Rococo ornament, reveals strong influences from north Germany.

An important Norwegian glassworks called Nøstetangen dates from this period; in addition to glass prisms and chandeliers, this firm also produced glassware for the table. A large chandelier decorates the choir of Kongsberg Church, which was executed after designs by H.G. Köhler in 1759–60.

The renowned faience factory of Herrebø at Halden also produced ceramic services, as well as tiles for German-style ceramic stoves. Around 1760 H.C.F. Hosenfeller (1722–1805) was summoned from Germany as a faience painter, and was also active as a portraitist and decorative painter. Hosenfeller's international standing contrasts with the status of the most renowned national artists at this date, such as the Danish painter Peder Aadnes (1739–92). Aadnes was the self-taught son of a peasant, and throughout his life he continued to combine farming with artistic commissions in the villages around Lake Mjøsa and Randsfjord. In his painting he merged a decorative style of rose painting with new features from Rococo decoration adapted from foreign models. His naive and charming interpretations of different stylistic elements reach a consummately high artistic level in the reception rooms of large farmhouses, where figure painting, landscape and marbling are combined on the walls, furniture and ceilings with a richness that surpasses that of any upper-class interior

and which demonstrates the strength of folk art's ability to survive at varying levels of society.

The strong individuality of Norwegian interior design at the end of the 18th century was the result of the combination of an upper-class, bourgeois and peasant society. During this period, the two most pronounced types of rural decorative painting – rose painting and acanthus painting – broadened and were merged, before finally withering away under the impact of stricter puritan ideals, and in the face of competition from industrial products such as printed wallpapers, which, by the middle of the 19th century overtook earlier commissions for decorative painting.

The Napoleonic era was a period of considerable social and political unrest. Norway had been under Danish sovereignty since the 16th century but was increasingly threatened by the imperialist ambitions of Sweden during the Caroline period of the later 17th century. This threat had disappeared after the war of 1719, and the 18th century was a period of peace. After the French Revolution, however, the Norwegian nation's dreams of independence were awakened. These hopes were definitively crushed in 1814 after Sweden granted Norway a joint union which lasted until 1905, and it was not until then that Norway became a sovereign state again for the first time since the Middle Ages.

The 19th century is called the "Swedish era", and in Norway it was an industrially and economically prosperous time, with costly building programmes in Christiania. A new palace was designed for the Bernadotte royal family by the Danish-born engineer officer and lawyer H.D.T. Lindow (1787–1851) in a straightforward Neo-Classical style. A grandiose city plan was proposed, with a university and other major buildings in the same character as those being built elsewhere, for instance in Berlin. The university building was designed by another Danish-born architect, C.H. Grosch (1801–65), who also designed the Stock Exchange and the Norwegian Bank, and several other monumental buildings along the newly laid-out triumphal street named after Carl XIV Johan, the king of Sweden and Norway.

The period's cool Neo-Classicism not only characterised the façades of buildings but also their interiors, and followed the same continental prototypes from France, England and Germany, as well as Sweden. Cast-iron stoves and furniture inspired by Danish and English models were common in many early 19th century town houses and villas. The 19th century was also a period of increasing national consciousness which sought its roots in the medieval and Viking periods, and in the culture of peasant art. One of the bright lights in the creation of a national identity was the painter Johan Dahl who helped to found art associations in Christiania in 1836, in Bergen in 1838 and in Trondheim in 1846. His volume of prints, published in German, was a propagandist attempt to preserve an older building tradition, especially that of the medieval stave churches which were increasingly threatened with destruction. The Viking decoration of stave churches thereafter became the national Norwegian style.

The Gothic style in architecture and interior decoration also came to represent an appropriately Norwegian style, as the Goths were widely considered to be the ancestors of the Scandinavian people. The most renowned example of Gothic Revival architecture is Oskarhall Castle near Christiania, built

for Oskar I in 1847–52 after designs by the Danish architect Johan Henrik Nebelongs. The king's ambition was to raise a national romantic monument to Norwegian nature, folklore and history.

During the last decades of the 19th century European-wide imitative styles spread through interior design in Norway, but, as in Sweden, the indigenous "dragon style" remained popular. An artist who managed to create a decorative renewal with elements of the national romantic spirit was the painter Gerhard Munthe (1849–1929). Munthe's work grew out of naturalism, but by the 1890s this had become more stylised, with peasant art as its main source of inspiration. He studied colours and materials from these sources so as to be able to reconstruct them in a new and decorative manner. His inspiration from Norwegian folk images resulted in cartoons for large woven tapestries for the palace in Oslo, with subjects from Sigurd Jorsalfar's tale; he also executed cartoons for tapestries for Holmenkollen and the restored medieval Håkonshallen in Bergen.

Following Norway's independence from Sweden in 1905, and after World War I, the search for a national expression became more widespread and the desire for an identifiable Norwegian art was promulgated in official commissions. During the 1920s and 1930s an interest in encouraging frescoes for public buildings was matched by schemes for large paintings on canvas or woven tapestries. At the end of the 19th and beginning of the 20th centuries national subjects had mainly been represented in book illustrations, but now, as in Renaissance Italy, there was a wish to create a living monumental art, as a constituent of interiors.

Several artists who were influenced by Matisse were awarded large decorative commissions in the 1920s. Axel Revold (1887–1962), for example, executed a series of frescoes on a rough unplastered wall in the Stock Exchange in Bergen (1920–23). Per Krohg (1889–1965) continued the fresco tradition, and some of his best attempts in this technique survive at the Sjomannskolan (Seaman's School) at Ekeberg (1921–24), and the University Library in Oslo (1933).

During the 1930s, Oslo's newly built Town Hall became Norway's most significant manifestation of artistic tastes. The decoration for the banquet hall was executed in a Cubist style by Alf Rolfsen, whose first decorative commission had been a wall in the Telegrafhuset in Oslo (1922). The most important artist to produce cartoons for woven tapestries was Henrik Sørensen (1882–1962); his most significant religious work was commissioned by Linköping Cathedral in Sweden in 1934.

During the 1890s architecture and interior design gained its first modern impetus from the study of the rational and functional elements in historic wooden architecture. H.E. Schirmer and Holm Munthe tried to create a new functional tradition of timber-frame buildings, with decorative applied sculpture in an Art Nouveau manner whose roots were in the Norwegian dragon style.

After the turn of the century stone architecture was reintroduced, using the English tradition as its closest model. The architect Bredo Greve's Technical High School in Trondheim (1902–10) heralded a break from the dependence on the medieval styles. One of the 20th century's greatest monumental commissions was the reconstruction and completion of

Trondheim Cathedral, which had never been finished during the Middle Ages. From 1909 architects, stone masons and others worked in a free style, endeavouring to recover knowledge about the qualities and methods of older architecture.

The first monument in independent Norway was the result of a competition in 1907 for a royal residence called Kongevillan. The succeeding years witnessed swift changes in stylistic currents. Attempts to build modern homes, restaurants and hotels in an Old Norse manner, characteristic since the 1890s, shifted during the 1920s to villas inspired by the Baroque. The works of Ole Sverre and Arnstein Arneberg can be compared to those of equivalent Swedish architects, such as Ragnar Östberg and Ivar Tengbom. The emergence of Functionalism as a reaction against historicism's influence, especially in relation to the Town Hall in Stockholm, gave a new face to Norwegian architecture and design. The first example was Lars Backer's Skansen restaurant in Oslo, dating from 1927. Among the most significant innovators were Ove Bang (1898–1949) and Arne Korsmo (1900–68).

Norwegian handicraft of the 20th century has mainly manifested itself in stained glass, silver, enamel and textiles. Emanuel Vigeland executed glass-paintings for the Oskar Church in Stockholm and for Oslo Cathedral. The rise of a renewed ecclesiastical stained glass tradition derived from the workshop at Trondheim Cathedral, where Gabriel Kielland was director from 1908.

Scandinavian Modern

“Scandinavian Modern” was a recognisable design aesthetic in furniture, textiles, and interior design (as well as glass, ceramics and metalwork) from the late 1930s to the early 1960s. It can be typified – in broad terms – as standing for simplicity in design, social awareness, and the use of natural materials. It combined high quality craftsmanship with Modernist ideals such as machine production, and Scandinavian Modern interiors evoke a sense of lightness and clarity. It was the first international modern style for mass-produced furniture, and permeated the “Contemporary” style during its ascendancy. It also succeeded in ousting, briefly, the perennial preference for period and reproduction styles in furnishing.

Scandinavia’s delayed industrialisation and urbanisation play a large part in the historical background to Scandinavian Modern. The gradual nature of this process, which did not fully develop until the end of the 19th century, allowed for the preservation of craft traditions, and the values of rural crafts strongly influenced the values of industrial production. The ideas and ideals of the Arts and Crafts movement also had a strong impact in Scandinavia, and pioneering efforts to reform the homes and design for the working classes were made in the early 1900s. The 1920s witnessed a revival of these craft traditions, with Swedish classicism (known as “Swedish Grace”) burgeoning at home and abroad, and winning prizes at the Exposition des Arts Décoratifs in Paris in 1925.

Kaare Klint’s research at the Royal Academy of Arts in Copenhagen on the relationship between the human body and furniture emphasised that furniture’s form should proceed from the measurements and shape of the human form. This, together with his revival of traditional chair designs (based on English 18th-century models), made a major impression on future design developments. In 1927 an exhibition at the Museum of Applied Arts in Copenhagen was organised by master cabinet-makers and joiners as a response to rising furniture imports and a proliferation of low quality furniture. This Snedkerlauget (Danish Cabinet-maker’s Guild) show became an annual event of international cultural significance.

An aggressively modern version of the Modern Movement, known as Functionalism, also developed in the 1920s, fuelled by the dogma of Walter Gropius and Le Corbusier. The Stockholm Exhibition of 1930 represented Scandinavia’s prin-

cipal endorsement of Modernism. Organised by the Swedish Society of Crafts and Design and funded by the state, it showcased the new housing and design ideals. “What is useful is beautiful!” was its no-nonsense slogan. Continental rationalism was most apparent in Gunnar Asplund’s exhibition architecture: the glass curtain walls of the Paradise restaurant seemed to float in space, and the experimental interiors contained tubular steel chairs and Constructivist patterned rugs.

In Finland too, Functionalism gained a strong foothold as part of the effort of the young Republic to establish itself as a modern nation. Alvar Aalto completed the Paimio Sanatorium in 1932, his first major commission. The famous *Chair 41* for the Sanatorium translated the principles of tubular steel frames into laminated birch, thereby using indigenous materials. It was in the mid-1930s that Aalto and his wife Aina set up the company ARTEK, manufacturing and marketing his self-styled “architectural accessories”.

Bruno Mathsson, another interpreter of continental Modernism (and an admirer of Aalto’s work), was one of Sweden’s most innovative furniture pioneers. In 1934 he designed his *Eva* chair using his characteristic laminate frame and saddle girth upholstery, selling it by mail order from his small business in southern Sweden. Mathsson’s anthropomorphic and subtly curved forms won acclaim at the New York World’s Fair in 1939. The rationale of the Swedish contribution was summed up in the catalogue: “Swedish Modern means high quality merchandise for everyday use, available for all by the utilisation of modern technical resources. Swedish Modern means natural form and honest treatment of materials. Swedish Modern means aesthetically sound goods, resulting from the close co-operation of artist and manufacturer.” This collaboration between artists and industry, echoing the efforts of the Deutscher Werkbund, had been one of the main aims of the Swedish Society of Craft and Design for the preceding twenty years. The products on show in New York illustrated that the somewhat hard-edged rational Modernism of Stockholm 1930 had developed into a gentler, more humane Nordic aesthetic, which prompted an American critic to offer this label: “Swedish Modern – a Movement towards Sanity in Design”.

World War II affected the Scandinavian countries in different ways. While Denmark, Finland and Norway were badly hit, Sweden gained as a neutral haven for a number of leading European designers. The Viennese architect Josef Frank found refuge in Sweden in the early 1930s, starting work with the up-market Svenskt-Tenn company in Stockholm. His elegant narrow-plinthed desks from this time combine Modernism with turn-of-the-century Viennese and English 18th-century influences. His highly exotic, bold cretonnes helped trigger a revival of bright floral fabrics. Although aimed at an elite, Frank’s designs had an important effect on the Scandinavian Modern aesthetic and helped raise levels of ambition in the Swedish furniture industry.

Another look in the catalogue of 1939 reveals this fulsome message: “We know that good homes can only be created by healthy people in hygienic dwellings through education and knowledge, with furnishings that are in harmony with the times. We know that beauty and comfort should be for everyone ...”. Indeed, throughout the 1940s and 1950s design

reformers set out to educate newly-weds, as well as retailers and manufacturers, in the art of living through the aesthetic of the plain and practical. In fact, a whole new research industry focusing on the domestic scene took off, a typically Swedish phenomenon.

These statistics showed that 40 per cent of Swedish households lived in a single room plus kitchen – only the Finns of all the other nations in Europe had worse living conditions. The common practice of keeping the parlour for show, a no-go area filled by bulky Rococo-style furnishings, while the family crammed into the kitchen, was the antithesis of modern teaching.

An example of Scandinavian Modern's inventiveness was the influential TRIVA knock-down furniture designed by Elias Svedberg, Lena Larsson and Erik Wortz. It was launched by the Nordiska Kompaniet in Stockholm in 1944, and was the first collection consciously made for quick assembly, to facilitate transport and storage and to reduce costs. It consisted of versatile storage units, tables with extra leaves, light chairs, sofas and armchairs – all designed to “mix and match”, with the needs of the user in mind. With its curved “humanist” lines, this furniture helped create a light and informal atmosphere in the new Modernist apartments; typically set off with potted plants and picture windows framed by Astrid Sampe's bright and simply patterned cotton curtains.

After World War II, Danish design flourished, in particular the furniture industry. Indeed, for many people, Scandinavian Modern equalled Danish furniture, and the industry's teak furniture was a great commercial success in many parts of the world, especially in America and Britain. The Danish Cabinet-makers Guild undertook research and design projects with the Co-operative movement. The latter opened a store in Copenhagen in 1944, selling furniture designed by Børge Mogensen (a student of Kaare Klint's). These were low-priced practical designs such as sturdy chairs inspired by Windsor and Swedish stick-back models that a family could combine according to their specific needs. It exemplified the kind of values that led an American critic to write: “Danish Modern design is the visual expression of the socially-just society”.

Gradually, cabinet-makers and joiners began co-operating with designers, and the partnership between cabinet-makers and designer / architects became something of a Danish speciality. It is typified in the work of Hans Wegner, such as his classic chair called simply *The Chair* which was later to feature in the television debate between J.F. Kennedy and Richard Nixon. Wegner's more rebellious junior counterpart, Finn Juhl, preferred a less puritanical and more sculptural style. Poul Kjaerholm's elegant steel furniture was another result of this productive collaboration.

Responding to rapidly growing international demand, Denmark's furniture industry geared itself to industrial production with manufacturing companies like Fritz Hansen leading the way. Hansen manufactured Arne Jacobsen's acclaimed *Ant* beech ply chair in 1951 – Denmark's first industrial chair. What proved to be a record-breaking run began as a commission for the canteen of a large factory complex. Jacobsen was a believer in the total human design environment, exploring new technologies and materials. This is perhaps most apparent in the slick SAS Royal Hotel in Copenhagen for which he designed everything from the womb-like *Swan* and *Egg*

armchairs to the stainless steel cutlery in the restaurant. Vernon Panton forged new ground for the next generation with his one-piece cantilevered plastic chair in 1960.

Lighting also forms an integral part of the Scandinavian Modern interior as a consequence of the brevity of most Northern days. Ultra-modernist designer Poul Henningsen was a major innovator, from his first designs featured in the 1925 Paris Exposition. These early lights served as models for the *PH* collection of table and hanging lights. Combining aesthetic considerations with Modernist ideals, the *PH5* light of 1957 consists of mass-produced sheet metal circular flanges that distribute glare-free light evenly and efficiently. The same formula is used for the large *PH Artichoke* of 1958, with warm copper “leaves” spreading light without dazzle.

In recognition of the importance of the relationship of fabric to furniture, Scandinavian Modern woven textiles used simple designs for specific applications. This would prove an influential Scandinavian concept. War-time shortages of wool and cotton in Finland led to fruitful experiments with alternative materials: Dora Jung wove paper wall hangings, Gretha Skogster-Lehtinen's studio wallpapers used birch bark, grease-proof paper, and paper string (a major feature of Helsinki's Kestikartano restaurant's rustic interiors).

In the 1950s, weavers and designers such as Uhra-Beata Simberg-Ehrström and Eva Brummer used the traditional Nordic *rya* technique for wool rugs, using simple geometric compositions of muted purple, orange, green and blue. Rya rugs were traditionally used as bedcovers or as wraps on board fishing boats. Aalto's printed cotton fabrics for ARTEK were intended for window hangings, the geometric brickwork pattern of *Siena* being a typical example. Marjatta Metsovaara, Maija Isola and Armi Ratia (the latter founded the Marimekko firm in 1951) startled the world with their bold and vivid fabric prints, prompting references to “Finnish Flair” by commentators at the time.

Aalto's four-legged birch stool designs of 1954 (manufactured by Korhonen) were a variation on his three-legged stool of the late 1920s. They are characterised by structural unity stemming from the fan joints and flowing curves at the top of each leg. Ilmari Tapiovaara, apprentice of Le Corbusier in Paris and admirer of Aalto, designed his *Domus* chair for the Domus Academica student accommodation in 1946 (in production in America in the 1950s as *Finnchair*). Its construction of curved, laminated plywood used the same idea of simple, easily mass-produced parts that was developed in his later stackables. Young architect / designer Antti Nurmesniemi's birch laminate and teak sauna stool for Helsinki's Palace Hotel in 1952, showed clear homage to Finnish vernacular traditions in its distinctive horseshoe seat.

The sculptural forms of Aalto's lighting fixtures are a major part of his interiors, in tune with the organic curves of the other elements. Yki Nummi, lighting specialist of the next generation, created his *Modern Art* lamp in 1955 from a body of transparent acrylic tube with a translucent shade.

Scandinavian Modern relied to a large degree on the outstanding achievements of a relatively small number of “leading lights”; many also operated with equal facility in different areas: both being significant factors in the Scandinavian Modern success story. An outstanding figure is the internationally renowned Swedish textile designer Astrid

Sampe, predominant in modernising all aspects of domestic textiles. In 1937 she set up the Textilkammaren design studio at the Nordiska Kompaniet department store in Stockholm, managing it until 1971. One milestone in this history was the internationally acclaimed 1954 collection *Signerad Textil* (Signed Textiles). This included auditorium curtains, wallhangings, and room dividers, some of which used translucent fabric to separate space without obstructing light. Contributors included architects Aalto and Sven Markelius, artists Olle Baertling and Karl Axel Pehrson, and artist / designers Stig Lindberg and in-house textile designer Viola Grasten. The designs provided a rich spectrum of abstract, geometric explorations of form, line and colour, many inspired by contemporary art. The use of textiles as architectural adornment was particularly favoured by Scandinavians, Sweden benefiting from a 1937 policy requiring 1 per cent of public building budgets to be spent on artistic decoration.

Inherent in Scandinavian Modern is the “special relationship” of artist and industry. But this utopian vision was only fully realised after forty years of energetic design reform and celebrated by the Swedish Society of Crafts and Design with their H55 show at Helsingborg in 1955. It could also be said to mark the culmination of Scandinavian Modern. Well-designed high quality utilitarian and domestic interiors symbolised the fruits of the welfare state, a democratic way of life, and faith in new technologies and materials. The austere and minimalist atmosphere of Timo Sarpaneva’s Finnish section moved one member of the British press to conduct his morning worship there. The Swedes invited not only their neighbours to show: among the non-Scandinavian exhibitors the Japanese interior attracted particular interest.

The mid-1950s saw the launch of an international Scandinavian Design campaign, orchestrated by the diligent efforts of the national societies of crafts and design in a spirit of alliance. The benefits of this policy bore fruit at the Milan Triennales – the design Olympics – and with the critical and commercial success of the three-and-a-half year touring show around the US and Canada whose patrons were President Eisenhower and the monarchs of Scandinavia. This tour played a crucial role in fixing Scandinavian Modern in the international consciousness, and reached millions of Americans through the extensive media coverage it gained. No previous campaign had ever aroused so much general interest in the Nordic culture and way of life, with its democratic ideals and strong focus on the home and the family proving attractive concepts for the middle-class homemaker. The work of Scandinavia’s leading designers eventually reached the American market via Knoll Inc. and others. The Museum of Modern Art in New York was an equally important conduit for the Scandinavian Modern message.

By 1951, Scandinavian designers had their own “Nobel Prize” in the much publicised Lunning Prize established by Fredrik Lunning, the Danish-born American agent for the Georg Jensen company. Every year between 1951 and 1972, a jury drawn from the Scandinavian Societies of Crafts and Design awarded two generous travel grants.

In Britain, Scandinavian Modern was a role model for the Council of Industrial Design’s post-war “Good Design” movements. The CoID was desperate to raise the standards of design, and Scandinavian Modern featured heavily in its

publications. The Scandinavians were held to have happily married their craft heritage with Modernism. The Royal Society of Arts cited a number of Scandinavians as Honorary Royal Designers for Industry. Up-market retailers such as Heal’s and Woollands took turns in staging Scandinavian marketing campaigns. Later, Habitat embraced the Scandinavian ethos. Designers like Ronald Carter and Robin and Lucienne Day made pilgrimages to Scandinavian design studios, and Alan Tilbury moved to Copenhagen to work with Børge Mogensen in the 1960s.

So effective was the “Scandinavian Design” propaganda machine that many thought Scandinavian Modern a seamless whole. In fact, Sweden represented practicality and simplicity, the Danes elegance with tradition, and Finland what has been described as “dazzling virtuosity”. Each country’s history is distinct, but there has always been a constant flux of fruitful interaction between them.

By the mid-1960s the reputation of Scandinavian Design started to crumble. The new designers were beginning to reject the ideas of their forebears. An increased awareness of the needs of the developing world made its mark on design students, and the world’s social problems were given priority over issues of aesthetics. The whole rationale of design tuition was questioned, as were established tastes. Design of a far less durable kind became the order of the day. Italians and Americans took over the top billing. The British “Pop” aesthetic was a far cry from “natural” and “honest” (which by then meant staid and boring) Scandinavian Modern. But although Scandinavian design has been out of the international limelight for some years, many Scandinavian Modern classics continue in production and are used every day in the home and workplace, and young designers in Scandinavia are now re-evaluating Scandinavian Modern.

Scarpa, Carlo 1906–1978

Italian architect and designer

In his quiet way and despite a modest and very varied output, Carlo Scarpa is now recognized as one of the great original designers of his time. Of his generation, it is perhaps Scarpa and his work that have the most to teach at the end of the 20th century.

This recognition did not, however, come easily, and his work was never fashionable. The career of no other 20th-century designer reflects more clearly the problems which the culture of Modernism has had with the disciplines and practice of interior design and decoration. Though often dubbed *architetto poeta* in his lifetime, Scarpa was repeatedly dogged by the professional labelling of his times: at its most appalling when he was humiliated in court by the Venetian architects who brought charges against him for practising architecture without qualification. Nevertheless, he could not be diverted from a steadfast and convivial practice of painstaking, small-scale, personally-controlled, hand-crafted architectural expression. Slowly, his achievement was honoured; he was given a chair at Venice University (though called professor of decoration) and finally even accepted as architect. Tragically, the day fixed for his honorary architectural doctorate turned out to be that of his funeral at S. Vito d'Altivole, following a fatal accident in Japan.

Scarpa was a fine artist-craftsman, always critically aware of the great art of his time (as obviously influenced by Paul Klee and Piet Mondrian as by Le Corbusier), and of the decorative qualities integral to so much of Modernism outside architecture. His strength lay in his rare ability to detach from current fashion. With a deep understanding of his context, whether working on a building or exhibiting a set of existing works of art, he added and subtracted layers, revealed and enhanced the buildings or works in a unique way. His respect for his subject was always sincere and he saw himself equal to his predecessors in the game of space and form. When it came to presenting ancient works of art in a powerful and new way, Scarpa was not afraid to commit himself, combining conservation with modern design. At the Castelveccchio Museum in Verona (1956–64), for example, this involved much destruction. His ability to link past and present in new, vital but fitting ways appears appropriate and is highly popular without being in the slightest condescending.

Any theory of interior design (that is, interior architecture) must have near its core an attitude to the clarifying of the layers of fabric which make up a building – those which allow it to stand up, to be enclosed, to be pleasant to touch, sight, and sound, to perform new roles within old shells, and so on. There can be no *tabula rasa* for interior design, only a palimpsest whose past cannot be completely erased. Fine design demands a dynamic equilibrium between these differently scaled, differently formed layers, from door hinge to town plan, from spatial organization to floor finishing. With his unique understanding of layers and method of interior design, Scarpa is a figure of central importance. He worked centrifugally, as much as centripetally, a dynamic process almost unknown among architects; he worked outwards, generating architecture from inventive, controlled details, often

using mock-ups on site, while his skill is also (to quote his client in Verona) “the ability to find a comprehensive solution”. Always moving in and out at widely different scales, a sheet of drawings can, like Alvar Aalto’s, show a mind working away at a tiny detail and also sketching ideas for a complete space.

His design method was equally immersed in layers: he sketched on photographs of his context (often an existing building); he developed ideas in coloured pencils on prints of the context (often dyelines of yesterday’s plans); he sketched on Bristol board rather than tracing, overlaying on the one drawing, erasing without entirely losing the earlier image. And his confidence was inspiring – sketching the Cangrande space at Verona, the climax of his work, on photographs of the corner he has already dared to demolish!

Scarpa clarified the layers of history (at Castelveccchio and Querini Stampalia as elsewhere), eroding the surfaces, adding layers of sediment onto the built strata but never confusing them; linking a comprehended past to an authentic, identified present.

Long before conservation became taken for granted, he immersed himself in an understanding of and respect for the historic fabrics he was asked to work with. And long before Deconstruction joined the everyday palette, he was producing work which was always fragmentary, never closed, and never final. His work ranged from the interior of a bar (1931), small-scale restoration, glassware for Venini of Murano (1933–47), silver for Rossi & Arcandi of Vicenza (1977), and furniture in an elegant, rectilinear style to temporary exhibitions. He developed lasting relationships with the Venice Biennale and that city’s museums, Accademia and Correr. Sometimes, when he had a free hand, there can seem to be too many competing ideas, too much ceaseless and quirky invention – this is possibly evident in the Querini Stampalia (1961–63), the Brion chapel (1969–78), and the remarkable Veritti house in Udine (1956–61, still happily inhabited by the next generation of the family) with all its moving parts. But when he joins a conversation with equals – placing the stunning Cangrande statue in Verona, at the Palazzo Abbatelli in Palermo (1953–54), and perhaps particularly with the gallery for Canova’s plaster casts in Possagno – he stands as partner to these masterpieces in a way perhaps few other designers could emulate.

The Canova conversion and small extension (1956–57) is almost invisible from the outside; in his handling of daylight Scarpa produced an interior of exquisite subtlety. The casts themselves have the gentle tones of a Giacometti painting – off-white, with cream and grey patina, shining where much stroked, scoured with the absent-minded scratches of generations. The extension which encloses them is an essay in different whites, produced by the reworking of traditional renders, polished plasters, and marble with simple metal framing and glass. The works are selected and placed with the utmost care, not least the famous *Three Graces* which is first glimpsed to the side and to which one is drawn down a small, tapering hall. They are neither overpowered by the architecture nor set in the naked glare of an operating theatre, but recognized for themselves. The light changes wonderfully across the day and the seasons. The sculpting of daylight is a key 20th-century theme handled famously by Le Corbusier, Tadao Ando, and Louis I. Kahn (each a greater architect than Scarpa although Kahn was

a keen admirer). But none achieved it in a way comparable to this tiny, humanistic gem.

JOHN MCKEAN

Biography

Born in Venice, 2 June 1906. Studied architecture at the Accademia di Belle Arti, Venice, 1921–26: Dip. Arch. 1926. Military service, Italian Army, 1926. Married Ornorina Lazzari, 1934: son is the architect and designer Tobia Scarpa (1935–). Assistant to the architect Vincenzo Rinaldi, Venice, 1922–24; freelance architect, designer, and graphic artist, Venice, 1927–62, Asolo, 1962–72, and Vicenza, 1972–78; commissions for interiors from 1929. Artistic consultant to Murano Cappellin and Company Glassworks, Venice, 1922–30, and to Venini Glassworks, Venice, 1933–47. Design consultant, Venice Biennale, from 1941, and to Cassina and B & B Italia furniture companies, 1969. Assistant instructor, 1926–29 and 1932–33, professor, 1933–76, and director, 1970–78, Istituto Universitario di Architettura, Venice; head of design course, Istituto Artistico Industriale, Venice, 1945–47; head of visual studies course, Istituto Superiore di Disegno Industriale, Venice, 1960–61. Numerous exhibitions and awards including Diploma of Honour, 1934, and Grand Jury Prize, 1960, Milan Triennale, and President's Architecture Prize, Rome, 1967. Elected Honorary Royal Designer for Industry, London, 1969; member, Academy of Art and Design, Florence; Academician, Accademia di San Luca, Rome, 1976. Died in Sendai, Japan, 28 November 1978.

Selected Works

Interiors

- 1931 Café Laverna, Venice (interiors)
- 1936–37 Ca Foscari, University of Venice (restoration and layout)
- 1941 Design of the Biennale, Venice; design of subsequent exhibitions at the Venice Biennales of 1949 (Paul Klee); 1950 (Pavilion of the Art Book); 1952 (Tiepolo); 1956 (Venezuelan Pavilion); 1960 (Erich Mendelsohn); 1968 (Pursuit of New Structures)
- 1942 Pelizzari Apartment, Santa Fosca, Venice (interiors and furnishings)
- 1953–54 Palazzo Abbatelli, Palermo, Sicily (restoration and remodelling as the Galleria Nazionale di Sicilia)
- 1953–60 Museo Correr, Venice (building and interiors)
- 1954–56 Galleria degli Uffizi, Florence (redesign of 6 gallery layouts with Ignazio Gardella and Giovanni Michelucci)
- 1955 Manlio Capito Civil Court, Venice (interiors and furniture)
- 1955–57 Gipsoteca Canoviana, Possagno, Treviso (extension and interiors)
- 1956–61 Veretti House, Udine (building and interiors)
- 1956–64 Museo di Castelvecchio, Verona (restoration, remodelling and interiors)
- 1957–58 Olivetti Showroom, Venice (interiors and furniture)
- 1961 Sense of Colour and Mastery of Water Exhibition, Italia '61, Turin
- 1961–63 Fondazione Querini Stampalia, Venice (remodelling of ground floor and courtyard)
- 1964–68 Zentner House, Zurich (building and interiors)
- 1967 The Poem Exhibition, Italian Pavilion, Expo '67, Montreal
- 1969–78 Brion Cemetery, San Vito d'Altivole, Treviso (monument and chapel)
- 1973 Banco Popolare, Verona (building and interiors)
- 1975–78 Ottolenghi House, Bardolino (building and interiors)

Scarpa also designed shop interiors in Florence and Venice from 1928 and numerous exhibition layouts from the 1950s. He produced

designs for glassware for Venini of Murano, Venice, 1933–47, and for furnishings from c.1930.

Schindler, R.M. 1887–1953

Austrian-born architect and furniture designer

In 1935 the Los Angeles architect R.M. Schindler wrote, "The modern architect who has become the space architect, sees the house as an organism in which every detail, including furniture, is related to the whole and to the idea which is its source." From the late 1910s through the early 1950s Schindler designed well over 200 pieces of furniture. Many of these (couches, tables, desks, beds, and storage units) were built-in to his buildings. Supplementing these built-in pieces

were a number of mobile, free standing chairs, tables, and other pieces of furniture.

His view of built-in versus mobile furniture is revealed in his 1936 comment, "The furniture which is stationary [i.e. built-in] becomes part of the weave [of the design], until it is impossible to tell where the house ends and the furniture begins. The few pieces which are necessarily movable (chairs, etc.), become so in an accentuated degree. Moving, they are unfit to define the space conception and must therefore be eliminated architecturally for the sake of clarity. They are either folded up and stored away or made transparent to become inconspicuous."

Since Schindler was a product of the early Modern Movement in Vienna one would expect that his architecture as well as his designs for furniture would fit comfortably into the classic Modernist mode, but they do not. His early architectural experience and education under Otto Wagner, Josef Hoffmann and Adolf Loos, were quickly subverted when he came to America. Not only was he affected by working with Frank Lloyd Wright, but he was also deeply influenced by the "democratic" do-it-yourself atmosphere of the American Arts and Crafts movement. The task which he set for himself was how to produce strong works of architecture and furniture design, which at the same time would convey a sense of the commonplace.

Schindler produced his first designs for furniture shortly after he came to Chicago in 1914. An early example of this work is evident in his design for a Children's Corner at the Chicago Art Institute (1918), where both the built-in pieces as well as the mobile ones were rigorously situated within his rectangular space as elements which help to establish the design theme of the room. In this design and in his project for the Martin house at Taos, New Mexico (1915), he provided low-cushioned seating platforms, which function as furniture, but which at the same time assert that they are purely architectural elements, reflecting primarily changes in the floor planes.

For many of his early Arts and Crafts designs for mobile chairs, Schindler adopted the classic form of the box chair as it had been developed by Charles Rennie Mackintosh, Josef Hoffmann and other turn of the century European designers. However, in his box chairs, Schindler abandoned the idea of furniture being a finely crafted object. He adopted the ideal of Louise Brigham, who in her 1909 book *Box Furniture*, advocated that the home craftsman make her / his own furniture from wooden packing boxes. Schindler did not end up actually having his furniture made from packing boxes, but his use of crude material (everyday one-inch thick wood boards) and his simple joinery perfectly mirrors what Brigham had suggested.

Schindler was one of the first Modernist designers radically to change the scale of his furniture by lowering its height. As he wrote in 1936 "Contemporary pieces lose the excessive height of the historical products – medieval chairs, etc. – and tend to bring us closer to the floor, until in recent years we are able to sit again on low pillows without losing social caste." As his writings indicate, Schindler looked not only to Japanese interiors for his inspiration, but also to the low built-in seats found in traditional Islamic houses and to the interior seating provided in Middle Eastern tents, "where the scheme is based upon the idea of a sheltered bed rather than a house".

This lowness of scale can readily be seen in the furniture for

his own double house on Kings Road, Hollywood (1922), and in his famous Beach house at Newport Beach for Philip M. Lovell (1922–26). For these mobile pieces he used box-like Craftsman forms for his chairs. He worked out several different approaches to the seat and back which were placed between pairs of rectangular uprights (almost always made of rough redwood boards). Several of these chairs made use of simple canvas slings, others have slings which were cushioned in a rib-like fashion; still others had stuffed rectangular seats and backs which were supported by wood members. Much of the furniture for the Kings Road house was built-in, including desks, tables, couches and beds (the latter placed in his open "Sleeping baskets") on the roof.

In the Lovell Beach house, he introduced a half-inglenook, which, as a built-in architectural element, posed as a room divider between the living and dining spaces. This divider consisted not only of the couch placed at right angles to the fireplace, but also included low table surfaces, bookcases and enclosed storage. Like Wright and other Modernists of the 1920s and 1930s his ideal for the bedroom was a compartment similar to the cabins of an ocean liner. All the furniture in the bedrooms of the Lovell Beach house were built-in with the exception of beds which were on wheels, so that once the glass doors were slid open, the beds could be moved out onto the sleeping decks.

Schindler's most complete realization of built-in furniture, integral to changes in floor levels, can be found in his vacation house for C.H. Wolfe at Avalon on Santa Catalina Island (1929). Couches, beds, table surfaces all pose as interlocking steps leading from one level to another. These built-in pieces, together with a few mobile chairs and tables, disappear as furniture and become simply architectural elements.

For a brief moment in his career, at the end of the 1920s and on into the early 1930s, Schindler made a determined effort to pose as a more traditional modern architect and designer of furniture. During these years, he designed a number of pieces in polished steel (all of which, of course, had to be manufactured by professional metal workers). Inspired by the bent tubular furniture designs of Ludwig Mies van der Rohe and Marcel Breuer, Schindler produced his own versions. His first bent tubular chairs were produced in 1928, for the Braxton Art Gallery in Hollywood, while a later group were designed for Sardi's Restaurant in Hollywood (1932). He produced other designs in metal at this time for desk and floor lamps, tables, desks, ottomans, and bookcases.

With the increased availability of plywood as an inexpensive material, Schindler adopted it as his principal material for furniture construction after 1930. While on a few occasions he used more expensive plywood such as birch, walnut or mahogany, his propensity was to use the cheaper Douglas fir plywood. He continued to produce designs, in this case in plywood, which could be constructed by any carpenter or home craftsman. In fact, by the late 1930s he had modified many of his designs for small side chairs and tables so that they could be cut out of a single sheet (or in some cases two) of $\frac{3}{4}$ inch, 4 foot by 8 foot plywood.

His many plywood chairs of the 1930s and 1940s are somewhat similar to the concurrent designs of Frank Lloyd Wright, but Schindler's pieces more openly acknowledge the characteristics of thin sheets of plywood. Schindler always designed as

many pieces of built-in furniture as he could for his houses and other buildings. In one form or another, he pursued his fondness for combined room dividers and half inglenook seating. For example, in the W.E. Oliver house in Los Angeles (1932–34) the divider separates the entrance hall and staircase from the living space.

Another distinct body of work was his *Schindler Unit* furniture which consisted of storage units, tables with radios and phonographs, and seating, developed in 1934. His use of dramatically curved sections of plywood propelled these pieces into the then-popular Streamline Moderne aesthetic of the 1930s. His approach to these modular units was to make them as flexible as possible so that they could respond to different needs and to the individual spatial qualities of an interior.

The several parts of the storage section of his *Schindler Unit* could be combined to form various configurations of drawers, and open or enclosed storage. The seating of his “Schindler Unit” consisted of an upholstered rectangular seat which could be combined with a cushioned back, supported and held in place by a wide curved piece of plywood. These seats could be used as individual chairs (with an attached table if one wished) or as part of a series of units in a straight or L-shaped couch.

Although Schindler was in principle opposed to designing furniture independent of its interior space, he nonetheless did try to interest several furniture manufacturers and retailers in commercially producing and marketing his modular *Schindler Units*, but without success.

The realization of many of his goals in designing furniture came about during the last decade of his life. His small folding table / stool (1945), constructed of three pieces of plywood, captured the complex, interlocking volumes and planes of his architecture. These 1945 table / stools also respond to his desire that furniture be easily put away, and they exemplify a simple and open use of commonplace materials and methods of construction.

He continued to make use of plywood in his post-World War II furniture designs, in such pieces as he designed for the R. Lechner House in Studio City (1948) and the Samuel Skolnik house in Los Angeles (1950–52). In these pieces the somewhat fragile nature of thin members of plywood was accentuated in his built-in furniture, as well as in his movable chairs, stools and small tables. As was the case in his late buildings, Schindler introduced into his furniture a sharp angular quality, similar in many ways to what was then going on in the architecture and furniture of popular Moderne restaurants, drive-ins, and above all in signage.

Certainly, in the end, Schindler’s architecture and furniture are decidedly different from that of other European and American Modernists. This is apparent in his use of inexpensive commonplace materials, simply assembled, and most of all in the way he continually captured and reinterpreted the lively forms and motifs of popular Modernism.

DAVID GEBHARD

Biography

Rudolph Michael Schindler. Born in Vienna, 5 September 1887. Studied engineering at the Imperial Institute of Engineering, Vienna, 1906–11; studied architecture at the Vienna Academy of Art, under Otto Wagner (1841–1918), 1910–13. Married Sophie Pauline Gibling, 1919 (separated 1930): one son. Worked as a draughtsman

for the architects Hans Mayr and Theodor Mayer, Vienna, 1911–13. Moved to the United States, 1914. Worked for Ottenheimer, Stern and Reichert, Chicago, 1914; intern and assistant in the office of Frank Lloyd Wright (1867–1956), Chicago and later Los Angeles, 1916–21. In private practice, Los Angeles, 1921–53. Collaborated with Richard Neutra (1892–1970) and Carol Aronovici, 1925–31. Designed furniture from 1918. Published several articles on furniture and architectural space. Died in Los Angeles, 22 August 1953.

Selected Works

The architectural records of R.M. Schindler are housed in the Architectural Drawings Collection, University Art Museum, University of California, Santa Barbara. The collection also contains photographs, negatives, letters, building documents, models, and examples of Schindler’s furniture.

Interiors

- 1915 Martin House, Taos, New Mexico (building, interiors and furniture)
- 1918 Chicago Art Institute (Children’s Corner; interior and furniture)
- 1922 Schindler / Chase House, Kings Road, Hollywood (building, interiors and furniture)
- 1922–26 Phillip Lovell Beach House, Newport Beach, California (building, interiors and furniture)
- 1923–25 Pueblo Ribera Court, La Jolla, California (building, interiors and furniture)
- 1924 J.C. Packard House, South Pasadena, California (building, interiors and furniture)
- 1925–30 Barnsdall houses, Olive Hill, Hollywood (interiors and furniture)
- 1925–34 H. Levin House, Hollywood (textiles and furniture)
- 1926–31 S. Freeman House, Hollywood (furniture)
- 1928 Braxton Art Gallery, Hollywood (building, interiors and furniture)
- 1929 C.H. Wolfe House, Avalon, Santa Catalina Island, California (building, interiors and furniture)
- 1931 R.F. Elliot House, Los Angeles (building, interiors and furniture)
- 1932 Sardi’s Restaurant, Hollywood (building, interiors and furniture)
- 1932–34 W.E. Oliver House, Los Angeles (building, interiors and furniture)
- 1937–38 Lockheed Airliner (interior and furniture)
- 1940 A. Van Decker House, Canoga Park, California (building, interiors and furniture)
- 1948 R. Lechner House, Studio City, California (building, interiors and furniture)
- 1950–52 Samuel Skolnik House, Los Angeles (building, interiors and furniture)

Schindler’s first designs for furniture date from 1918 and he continued to design individual pieces and built-in furnishings until his death. His most well-known pieces included the all-metal adjustable floor lamp (1928), all-metal chairs, tables, lamps, etc. (1929–34), *Schindler Unit* furniture (1934), and the *Schindler* folding table/stool (1945).

Schinkel, Karl Friedrich 1781–1841

German architect and designer

A painter, town-planner, theorist, and designer of stage sets, panoramas, furniture, textiles, metalwork, ceramics and interiors, as well as architect, Karl Friedrich Schinkel was one of the most prolific and prodigious exponents of 19th-century Neo-Classicism. Much of his work was produced in versions of the Greek and Roman styles, but he was also strongly influenced by Gothic and English picturesque models, and his *Vorbilder für Fabrikanten und Handwerker* (1821–37) represents one of the first attempts by an architect to raise standards of design in mass-produced articles. Perhaps best-known today for the elegant and refined houses and interiors he designed for members of the Prussian royal family, his monumental public works in Berlin, executed for his patron, Friedrich Wilhelm III of Prussia, transformed the city from a provincial town into a Neo-Classical Imperial capital.

Like his contemporary, Leo von Klenze (1784–1864), Schinkel was strongly influenced by Friedrich Gilly's design for a monument to Frederick the Great. Schinkel began to study architecture with David Gilly (1748–1808), Friedrich's father, in 1798, following him to the newly created Bauakademie in

1799, where he received a firm grounding in both classical theory and sound construction. Schinkel spent the years 1803 to mid 1805 in Italy, where he was deeply impressed by the size and picturesque groupings of its ancient buildings. This experience was seminal in developing his understanding of urban design principals and building / site relationships. From 1805 to 1810, back in Berlin, he occupied himself primarily as a painter, set designer, and decorative artist. Schinkel's architectural career was delayed until the return of the Prussian royal family from exile (in 1809) and the beginning of the building boom that followed the defeat of Napoleon.

Schinkel's earliest important commission was a bedroom for Queen Luise at Schloss Charlottenburg (1809–10). From the first, Schinkel approached interior design simply, often even austere. He organized painted, wallpapered, or frescoed planar surfaces, classical door and window frames, cornice mouldings, and ceiling decorations, and rich colors within a precisely rectilinear series of spaces. Relief is shallow; rises are sharp. In Queen Luise's bedroom, pink painted walls are completely draped with sheer white muslin, producing a rosy glow that must have simulated the experience of waking at dawn in a silken tent.

The commission for the Charlottenburg bedroom led to a series of other royal commissions and to an appointment to the Technische Oberbaudeputation – the bureau responsible for supervising the design of public, royal – and religious buildings in Prussia, and for architectural preservation. Schinkel's royal commissions include the redesign of the apartments of the Königliches Palace (1810–14), design of a mausoleum for Queen Luise (1810), renovation of the Prince Heinrich Palace for the University (1812), design of the New Guardhouse (1816), interior design of Prince August's Palace in Wilhelmstrasse (1816–17), remodeling of the Berlin Cathedral (1816–17), interior renovation of Prince Friedrich's Palace including Schinkel's first Gothic room (1817), design of the Schauspielhaus (1818–21), design of the Schlossbrücke (1819–24), design of the Altes Museum (1822–30), design of the Neue Pavilion in the park at Schloss Charlottenburg (1824), design of the New Customs House (1826–32), design of the Bauakademie (1831–36), remodeling of Prince Karl's Palace (1827–28), design of Prince Albrecht's Palace (1830–33), and designs of various buildings at Schloss Glienicke (1824–35) and at Charlottenhof in Potsdam (1826–37). Many of these commissions also contained furnishings designed by Schinkel. The interiors of the Neue Pavilion in the grounds of the Schloss Charlottenburg, for example, included corner sofas and a great half-round sofa; this motif was repeated in rooms in the royal palace for Crown Prince Friedrich Wilhelm which also included a Gothic study, gilt-bronze tables and gilt armchairs with sphinx arm supports.

The enthusiastic reception given to the display upon their return to Berlin of artworks that had been looted by Napoleon's forces led to the decision to build a public art museum. The resulting building, now known as the Altes Museum, is generally regarded as Schinkel's masterpiece and as one of the greatest monuments of 19th-century Neo-Classicism. Its site opposite the Royal Palace on the north side of Berlin's most important urban square, the Lustgarten, gave Schinkel the opportunity to create a central place that would

organize the important but unrelated buildings around it – the palace, the cathedral, and the arsenal – into a coherent unity. The museum is designed to close and complete the space, creating an outdoor room for public ceremony. In it royal power, the church, and public culture were brought together as symbols of Prussian history and society. The façade of the museum is a majestic row of eighteen colossal Ionic columns lifted above the square on a plinth that gives the building a monumentality comparable to that of the far larger palace. Central emphasis is provided by a flight of monumental steps and a raised attic that masks the rotunda which is the center of the composition. It is as if the Roman Pantheon had been inserted into the center of a Greek temple. The steps lead to a double staircase that rises behind the colonnade, destroying the barrier between internal and external space, and creating a rostrum from which the full panorama of the Lustgarten ensemble could be viewed. The stairwell and back wall of the colonnade were decorated with vast murals illustrating the relationship of the arts to the history of mankind. Unfortunately these were lost in World War II bombings.

The ground floor of the museum was devoted to the display of sculpture and other antiquities; the upper floor was a picture gallery. Walls were covered with dark red tapestries and ceilings were painted in red, yellow and white classical patterns. Pictures were displayed on low wooden screens placed perpendicularly to the outside walls to take advantage of side lighting. The Altes Museum is now used primarily for the display of temporary exhibitions; its role in the museum system of a unified Berlin has not been established.

Schinkel's most charming commissions are the villas he created for Prussian princes and aristocrats. The most notable of these is Schloss Charlottenhof and its garden buildings, constructed for Crown Prince Friedrich Wilhelm. At Charlottenhof, Schinkel created an elegant Trianon, built into a terraced site so that its porticoed entrance gives the appearance of a one-storeyed Doric temple. The temple form is intersected by an asymmetrical mass that reaches out to engage the garden, itself a picturesque extension of the building. The walls of the portico are decorated in imitation of Pompeian frescoes; the interiors are painted in strong, vibrant blues and reds, and are filled with elegant neo-antique furniture including a desk of silvered wood also designed by Schinkel. No better example of poetic classicism can be found than this. A rational classical form has been transformed into an asymmetrical composition and inserted into an intimate Romantic landscape. It reveals the same sensitivity to place-making that had governed the design of the Altes Museum; Schinkel was as successful in merging buildings with nature as he was in creating great urban places.

C. MURRAY SMART, JR.

Biography

Born in Neuruppin, 13 March 1781. Studied at the Gymnasium in Ruppin, 1787–94; and at the Gymnasium zum Grauenkloster, Berlin, 1794–98; commenced architectural training under David Gilly (father of Friedrich) in 1798; enrolled in the newly-founded Berlin Bauakademie, 1799. Went on study-tour of Italy, 1803–05; second Italian journey with Dr. Waagen, 1824; visited France and England, 1826. Married Susanne Berger, 1805; 4 children. Artist and painter

of dioramas and panoramas, Berlin, 1805–08; active as a theatre set designer, 1815–20. Appointed Geheimer Oberbauassessor, responsible for supervising the design of public, royal and religious buildings in Prussia, and architectural preservation, 1810; promoted to Geheimer Oberbaurat, 1815; made Geheimer Oberaudirektor, 1830; Oberlandesbaudirektor, 1838. Remodelled many royal palaces and residences during the 1820s and 1830s. Played an active role in the reform of design education in the 1830s and published numerous designs for craftwork and industry from the 1820s. Recipient of many honours including Honorable Member, Accademia di San Luca, Rome 1825, Royal Bavarian Academy of Fine Arts, 1832, Academy of Fine Arts, St. Petersburg, 1834, Royal Institute of British Architects, 1835, and Academy of Fine Arts, Vienna, 1836. Suffered deteriorating health from 1836, had a stroke in 1840 and died in Berlin, 9 October 1841.

Selected Works

Schinkel's output as an architect, painter, designer and town planner was vast; a list of his architectural projects appears in Van Vynckt 1993; details of his furniture and decorative designs are included in Snodin 1991. In 1864 Schinkel's artistic estate, consisting of drawings, models and manuscripts, was purchased by the Prussian State. Large parts of this collection have now been dispersed to the Kunstgewerbemuseum, the Kupferstichkabinett and the Nationalgalerie, all in Berlin. Drawings relating to his work for royal residences are in the Schlösser und Garten (Schloss Charlottenhof), Potsdam, the Schloss Charlottenburg, and the Kunstbibliothek, Berlin. Important collections of furniture and other artefacts are in Potsdam-Sanssouci. A Schinkel museum has been set up in the Neue Pavillon, Charlottenburg, renamed the Schinkel Pavillon.

Interiors

- 1809–10 Schloss Charlottenburg, Berlin (interior and furnishings for Queen Luise's bedroom)
- 1816–17 Prince August's Palace, Wilhelmstrasse, Berlin (redesign of interiors and furnishings): Prince August of Prussia
- 1817 Prince Friedrich's Palace, Wilhelmstrasse, Berlin (interiors): Crown Prince Friedrich Wilhelm
- 1821–24 Schloss Tegel, Berlin (remodelling, interiors and furniture): Wilhelm von Humboldt
- 1822–30 Altes Museum, Lustgarten, Berlin (building and interiors)
- 1824–25 Neue Pavillon (Schinkel Pavilion), Schloss Charlottenburg, Berlin (building and interiors): Friedrich Wilhelm III
- 1824–26 Kavelierhaus (Danziger Haus), Pfaueninsel, Berlin (building and interiors): Friedrich Wilhelm III
- 1824–27 Königliches Schloss, Berlin (Crown Prince and Princess's apartment including decoration and furnishings for the Drawing Room, Star Room, Tea Salon, Library): Crown Prince Friedrich Wilhelm
- 1824–35 Schloss Glienicke, Berlin (building and casino, including interiors and some furniture): Prince Karl of Prussia
- 1827–28 Schloss Charlottenhof, Potsdam (remodelling and interiors): Crown Prince Friedrich Wilhelm
- 1827–28 Prince Karl's Palace, Wilhelmplatz, Berlin (interiors and furniture): Prince Karl of Prussia
- 1830 Roman Baths, Charlottenhof, Potsdam (building and interiors): Crown Prince Friedrich Wilhelm
- 1830–33 Prince Albrecht's Palace, Wilhelmstrasse, Berlin (conversion and interiors): Prince Albrecht of Prussia
- 1833–35 Schloss Babelsberg, Potsdam (building, interiors and furnishings): Prince Wilhelm and Princess Augusta

Schinkel designed metalwork for the Royal Iron Foundry, Berlin, and ceramics for the Royal Porcelain Manufactory, Berlin. Many designs for gold and silverwork were executed by Johann George Hossauer. Numerous designs for furniture for the royal residences were published by Ludwig Lohde, in 5 parts, from 1835–37.

Schlüter, Andreas c.1659–1714

German sculptor, architect and designer of interiors

Trained as a sculptor, Andreas Schlüter turned to architecture and interior design during the period in which he was working in Berlin after 1694, and he was particularly active in these spheres between 1698 and 1707 when he became artistic director for all his patron's projects. It was during these years that he designed the new suite of state rooms inside the Berlin Schloss which rank among the most important Baroque interiors in Germany. Unfortunately, despite the significance of this commission, Schlüter's work and influence are difficult to visualise today as nearly all his buildings and decorations have been destroyed.

Schlüter's early works in Poland include few interiors. Some ceilings with *voûtes* of figurative stucco in the summer residence of Wilanów near Warsaw have been attributed to him. These include putti riding on dolphins and sea horses in the king's bedroom and putti representing the four elements in an antechamber. Another attribution is a ceiling in a bourgeois house in Danzig which contains putti representing the four continents. The vivid and playful character of these groups reveals a knowledge of Flemish and Roman Baroque sculpture, most notably the work of François Duquesnoy.

Schlüter was called to Berlin to take up the position of court sculptor and teacher at the academy of art (founded 1696) in 1694. He travelled around the Low Countries and France in 1695, and in 1696 he visited Rome to purchase plaster casts of antique sculpture for the Berlin academy. His most important sculptural work in Berlin is the bronze equestrian statue (1696–1703) of Elector Friedrich Wilhelm, Margrave of Brandenburg (1640–88). At the same time, Schlüter began to take an interest in architecture; he designed an attic section for the arsenal (where he provided 22 keystones depicting heads of dying soldiers for the courtyard) and built the foundry. In response to discussions concerning the enlargement and rebuilding of the Berlin Schloss, he provided a design that transformed the irregular German Renaissance schloss into a Roman Baroque palazzo, consisting of four wings surrounding a central courtyard. His designs were accepted and building began in the autumn of 1698. Schlüter's contract, dated 2 November 1699, stated explicitly that he was responsible for all the work connected with the Schloss, including the interiors.

The rebuilding of the Schloss was a project close to the new Elector's heart. With the elevation of the sovereign duchy of Prussia to a kingdom very much in mind, Friedrich III, Margrave of Brandenburg (1688–1713) wanted a palace that was fit for a king and, accordingly, the new state rooms on the second floor had to be on a regal scale. The suite of ten rooms started in the east wing (*Spreeflügel*) with (from south to north) the staircase, *salle de garde* and two antechambers, followed by the king's conference chamber. This led eastwards to the king's private rooms in the oldest part of the Schloss, and the suite was continued westwards into the north wing (*Lustgartenflügel*) facing the garden with another six newly furnished rooms containing the *Rittersaal* in the centre (with its own staircase), two rooms of diminishing size on either side, and the chapel ending the *enfilade* to the west. The larger halls

Schlüter: Rittersaal, Schloss Berlin, 1698–c.1703

(the *salle de garde* and Rittersaal) had a mezzanine floor added to provide extra height and were treated as architectural chambers with an order of pilasters. The smaller rooms, by contrast, were decorated with textiles and tapestries. Until the Schloss's destruction during World War II the Rote Samtkammer still had the original red sammet wallcovering, bordered with silver. Most of the other textiles and some of the floors were renovated or remodelled in the later 18th or 19th centuries but Schlüter's ceilings remained in place.

Schlüter's point of departure for the design of these ceilings was once again Roman Baroque models, most notably the ceiling systems designed by Pietro da Cortona such as those in the Palazzo Pitti in Florence. Schlüter used these models in an innovative way and with the eye of a sculptor. Walls and ceilings were separated by either a proper entablature or a string course, and a high *voûte* of stucco work, incorporating figures and figurative reliefs, provided a generously curved frame for the central fresco. The ornamental *voûtes* were gilded, sometimes polished to different shades of gold, and had white stucco figures in front of them. In two rooms the stucco work curved into the ceiling and gave the impression of cupolas; one ceiling even incorporated mirrors. The Rittersaal had a particularly elaborate decoration with four large stucco groups representing the continents as overdoors, and a layer-like

sequence of string courses in complicated forms between entablature and fresco. The chapel at the end of the *enfilade* (also with added mezzanine) had galleries supported by free-standing *scagliola* columns. In the south wing Schlüter decorated another large hall, the Elisabethsaal, with reliefs after antique models in the *voûte* and a series of sixteen draped youths sitting on a string course – a translation into sculpture of Michelangelo's *ignudi* from the Sistine ceiling. Schlüter produced designs for the walls, ceilings, floors and probably furniture, and he even influenced the execution of the frescoes. He also participated in drawing up the iconographical programme which celebrates good government and the young monarchy. A fresco in the north wing, dated 1703, indicates the short period of time in which these rooms were finished.

Given his workload for the king, Schlüter executed few commissions for interiors outside the court, a notable exception being a palace for Graf Koldbe Wartenberg, the prime minister. This was demolished in 1889 but a copy of a preserved ceiling was built into a room in the Palais Ephraim in Berlin in 1987.

1707 marked a turning point in Schlüter's career. A tower he had designed for the northwest corner of the Schloss precinct had to be taken down to prevent its collapse and Schlüter was disgraced. Work on the Schloss was continued by

Johann Friedrich Eosander (1669–1729). Eosander doubled the size of the structure and continued the suite of state rooms to the west but his work still showed the overpowering influence of his predecessor's style. Schlüter's last interior in Berlin was a private commission: in 1711–12 he built a suburban villa for the minister Ernst von Kamecke whose main hall once again contains groups of figures representing the four continents.

After 1713 the new king, Friedrich Wilhelm I, cut down on his father's lavish spending on the arts, and Schlüter accepted an invitation from Tsar Peter I to go to St. Petersburg. The fact that Schlüter died the following year, and that so much rebuilding took place in the 18th century, has made it difficult to estimate the range of Schlüter's work. Only Monplaisir, a small villa in the grounds of the Peterhof palace, was completed by 1715, and Schlüter's designs may have been used for the interiors.

Some of his former assistants in Berlin, like Martin Heinrich Böhme who built the Palais Creutz in 1714–16, continued to work in his style, but none of their buildings has survived. A more permanent record of Schlüter's influence can be seen in the interiors illustrated by his assistant, Paul Decker, in his suite of copperplate prints, *Fürstlicher Baumeister; oder, Architectura Civilis*, published in Augsburg between 1711 and 1716.

JARL KREMEIER

Biography

Born in Danzig (Gdansk) or Hamburg, c.1659. Trained as a sculptor in the workshop of David Sapovius; travelled to study architecture in the Netherlands, France and Italy, 1695–96. Married Anna Elisabeth Spangenberg, 1694: 3 children. Employed as a mason and master sculptor in the service of King Sobieski of Poland, Warsaw, 1681–94; sculptor and architect in Berlin for Elector Friedrich III, Margrave of Brandenburg, 1694–1713; appointed Schlossbaudirektor, 1699; director of the Academy of Arts, Berlin, 1702–04; dismissed from all official posts, 1707; worked as director of architecture for the court of Peter the Great, St. Petersburg, 1713–14. Member, Berlin Academy, 1701. Died in St. Petersburg or Moscow, 20 June 1714.

Selected Works

Few of Schlüter's interiors survive, many having been destroyed during World War II and after, but examples of his designs can be seen in the engravings published by his pupil, Paul Decker, in *Fürstlicher Baumeister; oder, Architectura Civilis*, Augsburg, 1711–16. A copy of a Schlüter ceiling designed for the Wartenberg Palace has been installed in the Ephraim Palace, Berlin.

Interiors

- c.1689 7/8 Langer Markt, Danzig (stucco decoration)
- 1689–93 Wilanów Palace, Warsaw (stucco decoration for the ceilings)
- 1698– Schloss, Berlin (renovation and interiors, including
- c.1703 second floor state rooms: later expanded and completed by Johann Friedrich Eosander)
- c.1700 Schloss, Charlottenburg, near Berlin (rebuilding and decoration of the first floor oval hall)
- 1702–04 Wartenberg Palace, Berlin (interiors)
- 1705–06 Schloss, Potsdam (decoration of the ceiling of the main hall)
- 1708 Schlobitten, East Prussia (ceiling decoration)
- 1711–12 Landhaus Kamecke, Berlin (building and interiors)
- 1713–14 Monplaisir, Peterhof Palace, near St. Petersburg (designs for building and interiors; completed by others)

Scott, M. H. Baillie 1865–1945

British architect and designer of interiors and furniture

A leading member of the Arts and Crafts Movement, M.H. Baillie Scott is important chiefly for his contribution to the interior design of domestic space. His importance rests not only on the exceptional richness and craftsmanship of his decorative schemes, but also on his innovative planning of interior space.

The eldest of 14 children of a minor Scottish laird, Scott studied at the Royal Agricultural College, Cirencester. Despite his father's hope that this would equip him to manage the family's sheep farming concerns in Australia, Scott turned to architecture as his chosen career. From 1886 to 1889 he was articled to Major Charles E. Davis, the city architect of Bath, where he worked on various classical schemes including the Queen's Bath building which enclosed the ancient Roman baths.

In 1889 he moved to the Isle of Man to join the office of the surveyor and land agent Frederick Sanderson, for whom he designed various houses, including Oakleigh (1892–93), Ivydene (1893–94), Laurel and Holly Bank (1895–96),

Scott: design for a Music Room; competition entry for House for an Art Lover, 1901

Leaffield and Braeside (1896–97), and a terrace of four houses at Falcon Cliff.

These early buildings were largely half-timbered and rough-cast mixtures of the Old English and Queen Anne styles as created by Richard Norman Shaw and W. Eden Nesfield, and, as such, partly out of character with the local vernacular. However at the same time Scott was attending classes at the Isle of Man School of Art, where Archibald Knox was on the teaching staff. With Knox he collaborated on the design and execution of stained glass, iron grates, and copper firehoods for these Manx houses whose Celtic Revival interiors are at odds with their more revivalist exteriors.

The house Scott designed for himself, the Red House (1892–93; so named after Philip Webb's house for William Morris) exhibited one of his most important innovations in the planning of domestic interiors. Here folding wooden screens separated the living from the dining and drawing rooms, thus allowing the creation of, Scott wrote, "one good sized apartment with plenty of floor space and elbow room." This ideological commitment to the re-introduction of the medieval open-hall plan both as the central element of an interior, and as a symbol of an open and liberal lifestyle (and, incidentally, the precursor of the typical suburban through-lounge), was shared at this time by many in the Arts and Crafts Movement, most notably Barry Parker, and had earlier precedents in the work of A. W. N. Pugin. While the hall-plan had the effect of

allowing a grand scale for decorative schemes, it also facilitated the creation of more seemingly eccentric corners and inglenooks with a preponderance of fitted furniture to reduce Victorian "clutter" and create a unified interior.

Underlying the use of the hall-plan was an almost abstract conception of space as an entity to be alternately contained, or set free, and to allow for variable room functions – the openness aided by enlarged doorways to rooms off the main hall. It has been a-historically interpreted by many as a harbinger of Modernist ideas of space as found later in the work of Le Corbusier and Gerrit Rietveld. Another favourite device of Scott's, well shown at Blackwell (1898–99) for Sir Edward Holt, was the creation of a gallery, traditionally intended for musicians, over a large inglenook fireplace, which was usually the symbolic centre of the Scott interior.

These early ideas, published as "The Decoration of the Suburban House" in *The Studio* (1895), led to Scott making regular contributions to the magazine which identified him with the progressive ideals of the Arts and Crafts Movement. In these influential essays (later collected and published as *Houses and Gardens*, 1906) Scott wrote of wanting to find again "the severe and earnest beauty of the old house". Accordingly, the 1896 exhibition of the Arts and Crafts Exhibition Society included furniture, metalwork and wallpaper designed by Scott. He always preferred to design every element of an interior himself and wrote that "the conception

of an interior must necessarily include the furniture which is to be used in it".

Scott neither lived in London nor moved within the central grouping of the Arts and Crafts Movement; this peripherality perhaps let his decorative work develop a richer, almost heraldic quality, more medieval in feel than the work of many of his contemporaries. *The Studio* became the effective vehicle through which his work and ideas became known and copied throughout Europe and the United States. As in the case of Charles Rennie Mackintosh, publicity created a situation in which Scott was more greatly admired and fêted in Europe than in his own country. This may also be due to his work being closer in feel to European Art Nouveau, with its greater accent on decorative richness and stylised motifs, than to the puritan strictures of the Arts and Crafts Movement.

Thus in 1896 Queen Victoria's grandson, Ernest-Ludwig, Grand Duke of Hesse, commissioned Scott to redecorate and furnish the drawing and dining rooms of his famous Artists Colony in Darmstadt, in collaboration with C.R. Ashbee and the Guild of Handicraft. The scheme is long since destroyed, but Scott's account of it records a vivid interior: "In the sitting room at Darmstadt the panelling is ivory white and above this the wall is orange. The central electric light fittings, designed by Mr. Ashbee, are grey pewter and the furniture is chiefly in tones of green and blue. And this arrangement of white, grey, green, and blue is supplemented by touches of brilliant pink in the flowers. In the dining room a more sober colour scheme prevails, the wall above the panelling being covered with embossed leather."

Though surviving photographs suggest a more even use of colour to unite the two rooms, the scheme established Scott's European reputation as an interior designer. The following year the duke's sister-in-law, Crown Princess Maria of Romania, commissioned Le Nid, a small forest villa provided with internal decorative unity through the application of stylised Sun, Sunflower, Lily and Poppy motifs stencilled on the ceiling, walls and other surfaces.

Scott's work was particularly well-received in the Germanic countries, and Hermann Muthesius claimed in *Das Englische Haus* (1904–05) that "In Baillie Scott's work each room is an individual creation, the elements of which do not just happen to be available but spring from the over-all idea. Baillie Scott is the first to have realised the interior as an autonomous work of art." Scott's schemes were published not only in *Dekorative Kunst* (1900) and *Kunst und Kunsthandwerk* (1901), but also in the American publication *House Beautiful* in 1904. Scott's *Houses and Gardens* was translated into German in 1912 and illustrated by many colour plates of his early commissions, which tend to reflect the general interest in folk or peasant culture of these years.

In 1901 Scott left the Isle of Man and moved to Bedford, a move partly informed by the presence there of John Pyghtle White's joinery for which he had designed furniture since c.1898, which was sold through Liberty's. The same year White published colour plates of these designs in *Furniture Made at the Pyghtle Works, Bedford*, and submitted designs for the Haus eines Kunstfreundes (House for an Art Lover) to the Zeitschrift für Innendekoration competition at Darmstadt. Alexander Koch illustrated the scheme in his influential

Meister der Innendekoration in 1902, and it was placed higher than the better-known entry of Mackintosh.

Where Scott's work for the Grand Duke exemplified a heraldic stiffness (at times bordering on revivalism) that was seeking to avoid the sinuous forms of Art Nouveau, his White Lodge, Wantage (1898–99) is a mixture of Voysey-like restraint externally and Art Nouveau richness internally – a general characteristic of his work. Scott's considerable admiration for Voysey was at its highest in the early years of the 20th century, when he sought the same rational approach to house design and decoration – what he termed a "quiet dignity of effect".

It was not surprising that Scott's well-publicised ideas on improved planning led to his involvement in the Garden City Movement, first with the design of Elmwood Cottages (1904–05) for the First Garden City Company at Letchworth, and then at Hampstead Garden Suburb in 1909 with the design of Waterlow Court. Arranged as a courtyard, or quadrangle, this was a development of flats for single women, and their servants, with communal facilities. It was constructed of whitewashed brick, with furniture supplied by John Pyghtle White and by Heal's. Scott had earlier written of seeking a general effect in his interiors that was still to be found in "some old Cheshire farmhouse ... where people have not yet grown to be ashamed of plain bricks and whitewash". A favourite aphorism of Scott's was "When in doubt whitewash."

On the completion of Waterlow Court, Scott moved away from some of the mannerisms of Voysey to a more traditional Tudor Revival manner, as seen in The Cloisters, Avenue Road, London (1912–13). Between 1914 and 1939 his commissions trailed off for want of clients and he alternated among a variety of styles, eventually acquiescing to the constraints of the fashionable neo-Georgian.

The considerable success Scott enjoyed was perhaps due as much to the power of the new artistic periodicals, such as *The Studio*, with their international readership, as to the undoubted quality of his work.

JULIAN HOLDER

Biography

Mackay Hugh Baillie Scott. Born near Ramsgate, Kent, 23 October 1865. Graduated from Royal Agricultural College, Cirencester, 1885; articled to Charles E. Davis, city architect of Bath, 1886–89; attended evening classes, Isle of Man School of Art, under Archibald Knox (1864–1933), 1889. Married Florence Kate Nash, 1889 (died 1935). Commenced architectural practice, Douglas, Isle of Man, 1889; relocated to Bedford 1901; practice moved to London c.1914; in partnership with A. Edgar Beresford from 1919. Designed furniture, metalwork, wallpapers and interiors from mid-1890s; involved in the development of Letchworth and Hampstead Garden Suburbs. Regular contributor to *The Studio* from 1895; wrote on interior decoration, town planning and garden cities. Exhibited frequently in England and abroad. Elected Fellow, Royal Institute of British Architects, 1927. Retired, 1939. Died in Brighton, 10 February 1945.

Selected Works

A collection of Scott's architectural drawings is in the Royal Institute of British Architects; additional drawings, designs and furnishings are in the Victoria and Albert Museum and the Manx Museum, Isle of Man. Many views of his interiors and examples of his furniture are illustrated in *The Studio* and *Building News*.

Interiors

- 1892–93 Red House, Douglas, Isle of Man (building and interiors): M.H. Baillie Scott
- 1896–98 Grand Ducal Palace, Darmstadt, Hesse (dining room and drawing room: decoration and furniture): Grand Duke Ernest-Ludwig of Hesse
- 1897–98 Glencrutchery House, Glencrutchery Road, Douglas, Isle of Man (interiors including the dining room, drawing room, hall): Deemster Thomas Keen
- 1897–98 Le Nid, Sinaia, Romania (interiors and furniture): Princess Marie of Romania
- 1898–99 Blackwell, Bowness, Westmoreland (building and interiors): Sir Edward Holt
- 1898–99 White Lodge, Wantage, Berkshire (building and interiors): Chaplain of St. Mary's Convent
- c.1900 Reiss House, Mannheim, Germany (interiors including music room and boudoir): Carl Reiss
- 1901 "Dulce Domum" (competition designs published in "Zeitschrift für Innen- Dekoration", Vienna): Alexander Koch
- 1902–05 Wertheim Residence, Berlin (music room and dining room): A. Wertheim
- 1907–14 Waldbühl, Uzwil, Switzerland (building interiors including furniture): Dr. Rolf Bühler
- 1908–09 Waterlow Court, Hampstead Garden Suburb, London (building and interiors)
- 1916–17 White House, Great Chart, Kent (remodelling of interiors and furnishings): M.H. Baillie Scott
- 1920–21 Oakhams, Edenbridge, Kent (remodelling of interiors and furnishings): M.H. Baillie Scott

Furnishings

Scott designed complete interiors, furniture and other decorative work for the Werkstätte, Dresden, 1900–14, and for the Wiener Werkstätte, Vienna, 1905–14. A catalogue of the Pyghtle Works, Bedford, contains 120 items of furniture designed by Scott who worked with the firm c.1898–1916; he also designed work for Storey & Co., 1914–17. Designs for wallpaper, fireplaces, stained glass, ironwork, furniture and embroideries appear in *The Studio* from 1895.

Screens

Screens are essentially movable structures, usually constructed from a wooden frame of several panels and covered by a wide range of materials. Traditionally, their primary use was to provide protection from heat or draught, or to divide a room into smaller spaces. In Northern Europe, the practice of using fixed and temporary wooden screens in great halls and churches was well-known during the Middle Ages, but the basic form of the folding screen comes from China. The earliest surviving examples date from the 8th century AD, and are now in the Shoso-in repository in Nara, Japan.

In the East, screens were used both as a functional piece of furniture and as a decorative art form. In Japan, screens were usually made of paper and were used as sliding panels, called *fusuma*, to form interior walls in domestic houses, or as *byōbu* (the word *byōbu* means protection from wind), free-standing six-panelled folding screens. In China, where houses had permanent walls, screens did not have to be moved as often, with the result that they tended to be made from less delicate materials such as panels of wood. Here, emphasis was placed on beauty and inspiration rather than mobility and flexibility.

Oriental screens were usually decorated with genre subjects such as birds, flowers, tea ceremonies and harbour scenes, either painted horizontally with inks onto hand-made paper stretched across a wooden frame, or by the much lengthier process of painting separate wooden panels with black lacquer. This was done either by applying raised layers of gesso, called *gofun*, to the surface and moulding it into reliefs of rocks and birds which were then gilded, or by cutting into the decorated surface and adding coloured dyes and powders to the grooves or to the lacquer itself. The surface was then further enriched by the addition of pieces of ivory, turquoise, jade, coral, abalone and lapis lazuli.

Although earlier records exist of movable screens being used, folding screens do not appear to have become fashionable in Europe until the 17th century, when screens were being imported by the Dutch and English, via recently established trade routes from the East. The first ship carrying varnished screens to return to England from Japan arrived in 1614. Charles I apparently possessed two Chinese screens, and Ham

House had several Japanese screens by 1683. The demand for oriental screens in the West and the dramatically enlarged European market influenced the artists producing them. This influence can be seen in the Western perspective and architecture chosen for an unusual concave nine-fold screen, *View of Amsterdam*, from the Ch' ien Lung period, 1736–95, clearly made for export to Europe.

Coromandel screens from China were considered the finest of all incised lacquerwork produced in the East. In particular, fashionable Chinoiserie interiors often included a Coromandel screen, such as the bedroom at Erdigg Park in Wales decorated in 1771. Eventually, however, the name Coromandel (so-called because of the coastal region in India where one of the main markets for screens was situated) became a general term used to describe all lacquerwork imported from the East.

By the 18th century, screens were covered in a wide range of materials including silk; paper; stamped, gilded or painted leather; inlaid woods; bronze; giltwood; mirrors or glass. An early 18th-century trade card belonging to Thomas Bromwich, a well-known wallpaper manufacturer on Ludgate Hill, London, declared he sold screens made of “gilt leather, India Pictures, Chintz, Callicos, Cottons, Needlework, Damask, Paper”. Painted paper screens were especially popular in England and France where the wallpaper industry was closely allied to screen-making. Screen panels were often backed by fabric before being fitted into the screen frame, similarly, wallpaper was first mounted onto pieces of canvas or hessian before being attached to a frame on the wall.

Throughout the 17th century, gilded leather screens were being produced in Spain and the Netherlands, where there was a large gilt leather-working industry, but by the 18th century, England's leather trade was sufficiently established to rival it. In England, however, stamped leather as a form of decoration was less important than painted leather or canvas.

The English appear to have favoured simple countryside scenes on their screens, although these designs tended to be rather less sophisticated than their European counterparts. An English four-panelled canvas screen, dated 1746 (now in the Victoria and Albert Museum), beautifully illustrates this rather naive style. Painted on both sides by an unknown hand, the screen depicts scenes of men fishing, gambling, cock-fighting and card-playing, the various sports and entertainments enjoyed by the typical English country gentleman of the period. English screens were also hand-made, usually by gentlewomen, who decorated an otherwise ordinary piece of furniture by sticking on engravings and pictures cut out of books, magazines and newspapers and then varnishing it. A wonderful exception to this practice is the screen made by Lord Byron, c.1811–14, covered with approximately 150 mezzotints and engravings of famous people and boxing heroes.

In 18th-century France, screens were usually made of more luxurious materials such as exotic woods, silks or tapestries from the famous Savonnerie, Beauvais, Gobelins and Aubusson factories. The Louvre has a fine gilt bronze screen covered with taffeta and embroidered silk made in 1786 for Louis XVI, by the firm Pernon. Some screens were made after designs by leading artists of the day, for example, François Boucher (1703–70) designed a five-panel screen for Louis XV, c.1750, and pastoral paintings by Antoine Watteau (1684–1721) and Nicolas Lancret (1690–1743), inspired the Rococo giltwood

screens now in the Victoria and Albert Museum. As well as those produced for the very rich, however, screens were also mass produced to fulfil the demands of an increasingly prosperous middle-class market.

Rococo screens, usually four to six panels wide, were meant to create pleasant, draught-free spaces for small groups or more intimate “situations” for those entertaining in their private rooms. But by the second half of the 18th century, as the taste for symmetry and minimal clutter changed the ways rooms were laid out, the use of screens declined. An exception to this are the beautifully carved, gilded and painted Neo-Classical screens produced by Turin-based, Giuseppe Maria Bonzanigo (b.1745), who produced furniture for the House of Savoy.

Folding screens enjoyed a revival in the latter part of the 19th century, especially with the Aesthetic Movement in England, when the art of the Orient once again found favour in Europe. Liberty's of Regent Street in London, for instance, specialised in the sale of imported Japanese goods such as vases and screens, and Moorish wooden screens were popular for a brief period in the 1890s.

By the turn of the century, as improvements were made to conditions within the domestic interior, so the screen became less a functional piece of furniture and more a surface for decoration. A surprisingly impressive list of well-established artists have at one time or another used screens for this purpose, including Paul Cézanne (1839–1906); William Morris (1834–96); James McNeill Whistler (1834–1903); members of the French Nabis group; Alphonse Mucha (1860–1939); Paul Klee (1879–1940); Marc Chagall (1887–1985) and Yves Tanguy (1900–55).

It did not take long, however, before artists were using the screen not as a piece of furniture or merely a decorative surface, but as an art form in itself. Eileen Gray (1879–1976), an artist and interior designer, was working in the revived technique of lacquer-work in Paris during the 1920s, where both she and Jean Dunand (1877–1942), received training in their medium from the Japanese master-craftsman Sougawara. In 1924, Gray took the idea of the traditional folding screen one stage further, in her work for Suzanne Talbot's Parisian apartment. In designing lacquer screens made from multiple blocks of wood arranged on fixed poles, she created a modernist three-dimensional sculpture.

More recently, and not unlike the Japanese artists before them, Jim Dine (b.1935) and David Hockney (b.1937), have used the screen as an extended canvas, examples of their work being Dine's five-part, *Landscape Screen* (1969), and Hockney's *Paper Pool* #10 “*Midnight Pool*” (1978), made from coloured and pressed paper pulp. The photographer Ansel Adams (1902–84), also used screens as invisible supports for his work.

Second Empire Style

Second Empire is the name given to the style or styles that flourished in France during the reign of Napoleon III (President 1848, Emperor 1852, abdicated 1870). Exemplified by the taste for elaborate hangings, brightly-coloured floral patterns, and comfortably rounded and abundantly upholstered, tasselled and deep-buttoned furnishings, as well as a plethora of revivalist styles, the Second Empire style has often been described as excessive and eclectic. Nevertheless, it was hugely influential both in France and abroad; its richness and variety was matched by that of High Victorian revivalist design and it was exported to all parts of the world.

"With the name I bear I must have either the gloom of a cell or the light of power", wrote Louis Napoleon Bonaparte, who was born in 1808 while Napoleon I was at the height of his power and placing his relatives on European thrones from which he had temporarily dislodged the legitimate occupants. As a seven-year-old prince, Louis Napoleon had been on the Champ de Mars in Paris when the Emperor celebrated what he believed was the restoration of his Empire; but already time was running out. Eighty of the Hundred Days had passed, and the boy's first taste of Imperial splendour was to be his last for many years. Exiled with his mother, ex-Queen Hortense of Holland, to Arenenberg in Switzerland (where the tented rooms and Empire furnishings she took with her may still be seen), he watched from a distance what was happening in France.

In 1830 the revived Bourbon monarchy was overthrown and Charles X gave way to the Citizen King, Louis-Philippe of the Orléans branch. Two years later the Duke of Reichstadt, Napoleon's only son and heir, who was previously known as the King of Rome (and for whom Percier and Fontaine had

designed a magnificent but unbuilt palace) died in Vienna, and Louis Napoleon's destiny became clear to him. He was to be the next Emperor; but it was only by way of exile in America and then in London where, as well as harbouring thoughts of imperial glory, he was also admiring the parks, the squares and the new Regent Street. After an abortive attempt to return to France and overthrow the Orléans monarchy in 1840 there was an interval before 1848 when Louis-Philippe was deposed and the Second Republic was declared. Louis Napoleon succeeded in being elected President; and in 1851 a carefully arranged coup, supported by a referendum, paved the way for him to be proclaimed Emperor Napoleon III.

Republican opponents included Victor Hugo, whom Louis Napoleon tried to enlist on his side by inviting him to dine at the Elysée Palace, his first official residence which had been improved for his occupation. Hugo's description of the drawing-room as "extremely ugly" suggests he was reacting against the taste of the First Empire since he commented on "figures after the fashion of Pompeii on the panels [of the walls], and all the furniture was in Empire style with the exception of the armchairs, which were in tapestry and gold and in fairly good rococo taste". The Rococo admired by Hugo was to be the most popular decorative style during the Second Empire, but Neo-Classicism continued as an influence, although it was challenged by other past French styles from Henri II to Louis XVI, as well as oriental and medieval interests.

With the help of Georges-Eugène Haussmann, the Emperor transformed the old Paris by the imposition of a pattern of boulevards, avenues, secondary streets and intersections that is still the framework and fabric of the centre of the city, and new public parks were created on the London model he had admired during his exile. Napoleon's enthusiasm for promoting metropolitan improvements, of which he evidently had a good understanding even if the motives were perhaps more political than artistic, did not extend to other forms of art. He did, however, decree the Salon des Refusés which brought about an end to the undisputed authority of the Salon and the École des Beaux-Arts. Émile Zola described the newly created setting as "quite as luxurious as that provided for the accepted pictures; tall, antique tapestry hangings in the doorways, exhibition panels covered with green serge, red velvet cushions on the benches, white cotton screens stretched under the skylight".

The Emperor also intervened in the design of the central markets at Les Halles, stopping work when he saw the solid structures going up to Victor Baltard's designs. The much-admired iron and glass pavilions were a revision by the architect to meet the Emperor's demand for "vast umbrellas". Zola described them as a "Babylon of metal with a hindu-like lightness, criss-crossed by suspended terraces, overhead corridors and flying bridges over the emptiness below". They were constructed between 1853 and 1857. At about the same time the Emperor decreed the construction of a permanent exhibition building, the Palais de l'Industrie on the Champs Élysées, "similar to the Crystal Palace in London". It housed the 1855 Exposition Universelle under its iron and glass interior; but the outstanding concept of an internal space fashioned of these materials is the Bibliothèque Nationale of 1862-68 where

Second Empire: *The Royal Visit to Napoleon III: Queen Victoria's Dressing Room at St. Cloud* by Fortuné Fournier, 1855

Henri Labrousse used rows of shallow domes supported on slender columns and arches.

The reign of Napoleon and his Spanish-born Empress Eugénie is remembered for its opulent, lavish court which became a byword for frivolity and extravagance. The decorative arts, in which the Empress took a great interest, pandered to this taste. In France, as in England, the mid 19th century was the apogee of eclecticism and historicism, and the international exhibitions of 1855 and 1867 displayed a variety of styles, innovations and intricacy just as did those of 1851 and 1862 in London. There was also a great interest in polychromy, partly inspired by many studies and reconstructions made by young French architects who had studied in Italy and Greece. But there were few such extreme archaeological reconstructions of interiors as the *Maison Pompéienne* designed for the Emperor's cousin, Prince Napoleon, in 1856 by Alfred Normand; brilliantly coloured designs for this tour-de-force may be seen in the Musée des Arts Décoratifs, and a reconstructed panel in the Musée d'Orsay.

Far more common are decorations and furnishings based on earlier French styles which still existed. New interiors frequently looked back to 17th- and 18th-century models. The Empress had a particular liking for the Louis XVI style. She initiated a cult for the memory of Marie Antoinette, copying furniture from the years before the Revolution but adding a

quality of comfort and informality in the arrangement of furnishings in the rooms, especially in her favourite château of St. Cloud where much of the furniture was genuinely Louis XVI, although springs were added to the upholstery to soften the seats. Her enthusiasm introduced a new style which became known as *Louis XVI Impératrice*, which was widely popular following her example. The large extensions to the Louvre, begun in 1853 by Ludovico Visconti and continued by Hector Lefuel, included richly decorated apartments, of which one suite of grand salon, salon-théâtre, and salle à manger still exists with their gilded, painted ceilings, arabesque wall panels, huge mirrors and glittering chandeliers; the gilded chairs and sofas are enriched Louis XV in style, but once again a new degree of comfort has been added to the splendour.

Middle-class taste in general followed that of the court, and the new techniques available for imitating the traditional craftsmanship in wood and metal facilitated production on a large-scale of copies of 18th-century furniture. But here too the notion of comfort assumed great importance, together with a taste for warm, rich colours on the walls and floors. A writer in *L'Illustration* in 1851 described the fashionable accoutrements, the heavy portières or door-curtains, the silk cushions, the double draperies that sealed the windows, the fine carpets, and the concealment under velvets and tapestries of bare wood and cold marble. The upholsterer had become

indispensable. Scenic wallpapers were still being produced by Jean Zuber and by Desfosse et Karth (the latter firm produced a greatly admired *Le jardin d'Armide* for the 1855 Exposition Universelle) and popular repeating patterns included elaborate concoctions containing brightly-coloured and highly illusionistic representations of flowers and exotic foliage. But these were affordable only by the wealthy, and it was only after the introduction of machine printing that patterned papers became widely available to increase the sense of comfort and luxury in middle-class interiors.

There were, however, few such constraints on the owners of private residences built in the Champs-Élysées or on the fashionable boulevards which offered opportunities for opulent display. The most famously lavish, and one of the few still existing, is the house built by Pierre Mauguin between 1863 and 1866 (now the Travellers' Club) in the Champs-Élysées for a famous *horizontale*, the Marquise de Paiva. The staircase is either solid onyx or lined with the same material which was used too to cover the walls of the bathroom and to form the bath itself which is lined with silver-plated bronze. The drawing-room is decorated in an enriched Renaissance-Baroque style which incorporates life-size female nudes sculpted by Eugène Delaplanche and a painted ceiling by Paul Baudry; both artists were employed by Charles Garnier in the decoration of the Opéra. The furnishings were equally rich, as may be seen in a cabinet in Renaissance style inlaid with lapis lazuli, jasper and ivory which is now in the Musée des Arts Décoratifs.

Some older town houses were remodelled internally, such as the Hôtel Matignon in the rue de Varenne which was bought by a wealthy Genoese financier in 1852. Once again Baudry was employed, a marble staircase was installed, and the fine 18th-century *boiseries* were enriched with Florentine mosaics. The duc de Morny, the Emperor's step-brother, redecorated the Hôtel de Lassay on the quai d'Orsay, elaborating the *boiseries* and adding a splendid *salle des fêtes* which connects the residence to the Palais Bourbon.

On a smaller scale than these opulent houses was one well known to artists and writers, the residence in the rue de Courcelles of the Emperor's cousin, Princesse Mathilde Bonaparte. There were copies of Louis XIV and XV furniture in the comfortable drawing room, while the richly coloured dining room was a hybrid of 17th- and 18th-century taste. These rooms are recorded in watercolours in the Musée des Arts Décoratifs which recall how one contemporary writer thought "every rich or discriminating person who aspires to a little luxury is obliged to go back to the 18th century and to have it abjectly copied". But maybe there was also a conscious wish to identify with the *ancien régime*, just as the Empress came to identify herself with Marie Antoinette. However, *éclectisme* was the fashionable word in the Second Empire, and there were other decorative styles available for which there were pattern books such as those produced by César Daly which covered a wide stylistic range.

In 1860 Eugène Delacroix, one of the few first-class painters of the Second Empire, complained "architects are not inventing, they are copying the Gothic", which introduces another taste. In 1850, while still Prince-President, Louis Napoleon paid a visit to the château at Compiègne which, following his uncle's example, he was to make one of his favourite residences

although he made only one addition, the *galerie Natoire*. On that occasion he first saw the ruined castle of Pierrefonds which dates from the 14th century, and some time around 1857 he instructed Eugène Viollet-le-Duc to restore the building and make it habitable. A thousand men were employed for twelve years on the work, which included rooms richly painted in a medieval style, another example of the popularity of polychromy. The high-vaulted *chambre de l'impératrice* and the flat-ceilinged *chambre de l'empereur* both have huge fireplaces surmounted by heraldic decoration, and the walls are elaborately stencilled, but the highlight is the *salle des Preuses*, named after the nine statues of feminine types of chivalry at the end of the 77-metres-long room. These are of court ladies representing famous women of history. The Empress is in the centre, in the guise of the legendary Assyrian Queen Semiramis, while around her stand the ladies of the Imperial circle. The furnishings and *boiseries* were all designed by Viollet-le-Duc in a medieval style such as he was recording between 1858 and 1875 in his *Dictionnaire raisonné du mobilier français*. In 1865 he collaborated with Edmond Duthoit in a similar restoration, decorating and furnishing of the Château de Roquetaillade.

In 1869 the Emperor awarded the *prix* named after him to Louis Duc for the remodelling and extension of the Palais de Justice. The citation was that it was the greatest artistic achievement of the Empire. A large new building overlooking the place Dauphine contains the central monumental space, the Vestibule de Harlay which measures 45 by 20 metres. It is subdivided by pilasters crowned with unconventional entablature brackets which support segmental arches separating shallow domes that are linked visually by segmental ribs spanning across the bays, so creating a feeling of suspense in equilibrium. The six deeply recessed bays on the inner face of the outer wall are filled with figures of Prudence and Truth, Strength and Justice, Punishment and Protection. The only colour in the Vestibule is in the marble patterned floor, and the use of stone facing throughout the circulation spaces, including the vaulted ceilings of the long corridors, provides a strong sense of unity to the design of the whole building, which is of many dates externally. In general Duc's work is as it was described by a contemporary, "sévère de lignes, sobre de décoration, froid, de style grec", and not characteristic of the Second Empire. For the most part the other new interiors followed a Renaissance model in the woodwork and ceilings, but Duc could create richer effects, as in the staircase leading from the quai de l'Horloge to the Cour de Cassation. But the more opulent interiors, especially of the *Chambre Civile* with its richly modelled and gilded ceiling framing allegorical painted panels dates from the partial reconstruction of the building following severe damage during the Commune. This interior, almost as theatrical as those in the Opéra, is more in character with the general conception of the Second Empire.

The *Chambre Civile* would not be out of place in another building type that is characteristic of the Empire – the palatial Parisian hotel. The first was the 700-bedroom Grand Hôtel du Louvre, built in 1854–55 to coincide with the 1855 Exposition. Externally it complemented the street architecture of the First Empire, but inside Alfred Armand, its designer, set a new standard of luxurious decoration in the public rooms. In 1862 Armand followed this success with another Grand Hôtel

on a site adjacent to that of the new Opéra that was then under construction. This was even more luxurious. A large square cour d'honneur led into a vast hemispherical salle des fêtes which an enthusiastic guide book of the 1860s described as a "monument unique au monde" with its tiers of colonnades, its caryatid figures, its pendentives rising to a glazed dome, and its glittering chandeliers. The whole theatrical interior is painted wood and plaster, heavily marbled and gilded, and the finest decorative artists were employed for the paintings and carvings. When the hotel was inaugurated in 1862 in the presence of the Empress, she expressed her pleasure by saying how much she felt at home as she could believe herself to be at Compiègne or Fontainebleau. The interior of the salle des fêtes is the only original one to have survived, although it has recently been complemented by skilful pastiches of Second Empire decoration; but the elegant painted rooms of the Café de la Paix, which is a part of the hotel, are still extant.

The Grand Hôtel de l'Opéra and the adjacent Opéra together form a memorable image of the architectural and decorative quality of the Second Empire at its best; but by the time the latter was complete Napoleon and Eugénie were in exile in England, where the ex-Emperor died in 1873. The ex-Empress lived on until 1920. Their only son, the Prince Imperial, for whom the magnificent cradle in the Musée des Arts Décoratifs was made and who might have revived the belief in a Napoleonic destiny to rule, was killed by the Zulus in South Africa in 1879.

Semper, Gottfried 1803–1879

German architect, designer, teacher and theorist

Born in Hamburg, Gottfried Semper lived in Germany, England and Switzerland where his ideas played an important role in the development of late 19th and early 20th century architecture and design. Working as an architect, designer and teacher, he was most influential as a theorist. He formulated new ideas on the origins of style, and his view that function and technique were of primary significance in determining design had a profound influence on certain early exponents of Functionalism including H.P. Berlage and Adolf Loos.

Semper received his architectural training in Munich under Friedrich von Gärtner and subsequently in Paris where he worked for Franz Christian Gau and Jacques Ignace Hittorff. Between 1830 and 1833 he travelled extensively in southern France, Italy, Sicily and Greece where he developed a lasting interest in antique polychromy which was the subject of his first published work, *Bemerkungen über bemalte Architektur und Plastik bei den Alten* (1834). His admiration for the ornament and architecture of the Italian Renaissance, which informed much of his later design, also dates from this period. Returning to Germany in 1833, he met Karl Friedrich Schinkel in Berlin, and Schinkel helped him to obtain the post of Head of Architecture at the Academy of Fine Arts, Dresden, in 1834. Semper's reputation was already quite considerable by this time and his first major architectural commission to build the Royal Hoftheater augmented his fame. But his involvement in the revolution of 1849 resulted in his fleeing Germany for Paris where he made contact with Jules Diéterle and designed porcelain for Sèvres. Resident in London from 1850 to 1855, he worked first as a designer for the cabinet-makers Jackson and Graham. On the recommendation of Henry Cole he was then employed as designer of the Egyptian, Swedish, Danish and Canadian sections at the International Exhibition of 1851 and subsequently as a teacher at the School of Design. Semper did

not complete any architectural commissions during this period, but while in London he formulated the theories that were later expanded in *Der Stil* (1860–63). He moved to Switzerland in 1855 where he was Professor at Zurich Polytechnic until his retirement in 1871.

Semper's architectural work was rigorously historical and, according to Nikolaus Pevsner, it exemplified the waning of the simple neo-Renaissance style in the latter part of the 19th century. This trend is demonstrated in his two versions of the Dresden Opera House. Semper's first design for this building was completed in 1841 in a Renaissance style; his later version (1871–78) was erected after a fire, and displays greater Baroque grandeur. Other major works such as the Dresden Picture Gallery (1847–54), and the Museums of Art History and Natural History, Vienna (1872–79), are imposing displays of disciplined stylistic virtuosity.

In working on the Hoftheater, Semper stated that he tried to “make the exterior dependent throughout on the needs of the interior organisation”. The interiors of this building were executed by Edouard Despléchin, Charles Séchan and Jules Diéterle. Semper himself designed some of the furniture in the Hoftheater, and also some of the light fittings at the Dresden synagogue (1834–40), but he was primarily interested in the organisation of internal spaces rather than in the details of decorative schemes. A design for a “Hallway with a Bust of Dante” (1838) in the Institut für Denkmalfpflege, Berlin, which shows the tempering influence of classicism on his neo-Renaissance and Baroque French style, illustrates his competence in creating complete interiors, and some of his domestic houses also included decorations executed to his design. However, these are not well documented and have not survived.

Much of Semper's furniture dates from his stay in London where he not only designed for Jackson and Graham but also for Snell, and for Holland & Sons whose ornate cabinet was shown at the Paris 1855 exhibition. This cabinet was designed in an eclectic Renaissance style and featured ceramic plaques by Wedgwood depicting William Mulready's *Crossing the Brook*. It has been suggested that the inclusion of this pictorial device was not only in keeping with the French custom of mounting Sèvres enamels on furniture but was also Semper's way of creating a distinctively English piece (Gere and Whiteway, 1993). It is a practical expression of his theory that the ornament should relate to the item for which it was designed and should be used to express an idea (in this case Englishness) rather than being arbitrary.

Semper was adamant that architecture relied upon industrial design, and therefore believed the study of industrial design to be as elevated and as necessary as the study of architecture. “Architecture”, he wrote in 1852, “must step down from its throne and go into the marketplace, there to teach – and to learn”. He also maintained, in direct contradiction to the views held by his colleagues at the School of Design, that the industrial arts preceded architecture: “the history of architecture begins with the history of practical art and ... the laws of beauty and style in architecture have their paragons in those concerning industrial art”. He viewed architecture and industrial design as fundamentally connected and believed that only chronological precedence determined which took priority in the hierarchy of visual endeavour.

Semper discussed manufactured objects in terms of their function within the domestic interior. He identified four categories related to the materials involved in textiles, carpentry, pottery and wall construction which were themselves based upon the four basic forms of architecture, the floor, the roof, the hearth, and screens or walls. These categories were related to the structure of a primitive Caribbean hut where initially curtains were hung as room dividers and later replaced by tapestry. Semper proposed wallpaper as the 19th-century equivalent to curtains, claiming that the design of wallpaper was akin to that of textiles and that it served the same function of enclosing the walls.

Semper's ideas challenged those of his contemporaries both in the functionalist and materialist nature of his criteria and in his broad and pragmatic attitude to makers of art and craft. Yet his functionalist attitude to materials had later parallels: as early as 1834 he had written that iron should appear iron, a view that prefigured later ideas about the integrity of materials espoused by adherents of the Arts and Crafts movement. Nevertheless, Semper was not straightforwardly a materialist. He believed that the material expresses the idea in a design through function and production. He also emphasised the effect of social forces upon design. He recognised the detrimental effects of de-humanised mechanisation upon design but thought that if employed correctly, machines could assist good design. He was therefore forward-looking, while simultaneously aware of what may be learned from the past.

He regarded style as the result of social forces and he perceived the plundering of earlier historic styles – which is today considered Postmodern – as characteristic of his age. And in seeking to explain recurrent motifs and structures in architecture, he was led back to the fundamental domestic form of building which once again he represented as the Caribbean hut. Function provided the link between the approaches to domestic building throughout history, and therefore architectural forms were recycled.

Semper's problematisation of ornament prefigured a major concern of 20th-century designers. Objecting to the way in which ornament obscured traditional type-forms, he demanded that it be subordinated to the general impression. He sought a distinction between form and what he called “outer wrapping” – something that many Modernist designers also went on to do. Yet Semper's criticism of Thonet's bentwood chairs illustrates how his ideas also differed from those of the nascent Modern Movement. The influence of his approach to design education has perhaps proved more enduring. Believing that theory and practice were indivisible and mutually informative, he advocated a process of training based on practical activity rather than copying. These ideas not only arguably provided the structure for Bauhaus pedagogical theory, they also form the basis of much design education today.

Biography

Born in Hamburg, 29 November 1803. Studied law and mathematics at the University of Göttingen, 1823–25, and then architecture in Munich with Friedrich von Gärtner, 1825. Married Bertha Thimmig,

1835: sons included the architects Emanuel and Manfred Semper. Fled to France after fighting a duel, 1826. Worked in Paris for the architects Franz Christian Gau, and Jacques Ignace Hittorff; travelled to southern France, Italy and Greece, 1830–33. Active as an architect, and Director of the Bauschule of the Royal Academy, Dresden, 1834–50. Participated in a republican uprising, 1849; exiled to Paris where he met Jules Diéterle, then lived in England, 1850–55. Designed the Egyptian, Swedish, Danish and Canadian sections of the 1851 Exhibition; employed as a teacher in the Department of Practical Art, School of Design, Marlborough House, London, 1852. Professor and Director, Eidgenössische Technische Hochschule, Zurich, 1855–71; supervised Ringstrasse projects, Vienna, 1869–76. Designed porcelain from 1835, metalwork from c.1838, and furniture from the 1850s. Exhibited at the Paris 1855 exhibition. Published numerous influential books and articles on architecture, industry and design. Died in Rome, 15 May 1879.

Selected Works

Semper's cabinet of 1855 is in the Victoria and Albert Museum, London.

Interiors

- 1834–41 Royal Hoftheater, Dresden (building, and interiors with Edouard Despléchin, Jules Diéterle and Charles Séchan)
- 1847–54 Picture Gallery, Dresden (building and interiors; completed by Bernard Kruger and K. M. Hänel)
- 1858–64 Eidgenössische Technische Hochschule, Zurich (building and interiors)
- 1869 Kaiser Forum, Vienna (building)
- 1871–78 New Opera, Dresden (design of building and interiors; executed by Manfred Semper)
- 1872–79 Museum of Art History, Vienna (with Karl Hasenauer; completed 1881)
- 1872–79 Museum of Natural History, Vienna (with Hasenauer; completed 1881)

Semper designed porcelain for the Meissen factory (1835–49), and for Sèvres (1849). His designs for furniture included work executed by Jackson & Graham, Snell, and Holland & Sons.

Serrurier-Bovy, Gustave 1858–1910

Belgian architect and designer of furniture and interiors

Gustave Serrurier-Bovy was trained as an architect, but established himself in his father's profession as an entrepreneur and furniture designer in Liège, Belgium. Often noted as a crucial link between late 19th-century English design and continental Art Nouveau, Serrurier-Bovy was one of the first Belgians to participate in the international Arts and Crafts Movement. Around 1884 he established a dry goods shop in his native Liège that carried wallpaper, textiles and ceramics imported from Japan, India and the English department store Liberty's. A catalogue advertising his stock of *ameublements artistiques* is illustrated with images of English, American, Canadian and German interiors from contemporary architectural periodicals. In the early 1890s, when Serrurier-Bovy began producing his own furniture, he also arranged his showroom as a sequence of model interiors and the total design of the domestic environment, from furniture, wall coverings and textiles to light fixtures and picture frames, became his trademark.

Serrurier-Bovy was an active protagonist in the vibrant cultural life of turn-of-the-century Belgium. At the first salon of the Brussels exhibition society La Libre Esthétique, in 1894, he showed an interior installation, which he called a Cabinet de Travail. Fitted out with sturdy wooden furniture, including a table and chairs as well as a buffet and a standing clock, the room was completed by details such as a panelled frieze of

poppies, a beamed ceiling, a brick hearth and even a false window, giving the illusion of entering a private home. Although he later denied any influence from English art, critics described the cohesive coziness as distinctly related to contemporary English decorative design. The *Chambre d'Artisan*, created for *La Libre Esthétique* in 1895, showed a greater variety of furniture and art objects, and was accompanied by a pamphlet explaining Serrurier-Bovy's aim of demonstrating that "l'idée artistique nouvelle" was intrinsically related to his vision of social harmony. Inspired by the *La Libre Esthétique*'s example of showing the objects of everyday life as art, Serrurier-Bovy organized *L'Oeuvre Artistique*, an enormous exhibition of decorative art in Liège that same year. Walter Crane, C.R. Ashbee, and Heywood Sumner and other artisans associated with the British Arts and Crafts Movement who had shown their work at *La Libre Esthétique* in Brussels also participated in the Liège exhibition. Additionally, nearly 110 items were sent from the Glasgow School of Art, the French architect Hector Guimard exhibited several early projects, and Lugué-Poë's *Théâtre de l'oeuvre* performed Ibsen's *The Master Builder*. Serrurier-Bovy's interior design became increasingly well known through public exhibitions; in 1896, he opened a shop in Brussels and gained commissions from the liberal bourgeoisie there. At the Brussels Universal and World's Fair in 1897, Serrurier created a room displaying the riches of the Congo for the Colonial Exposition at Tervuren, a project in which Belgian architects Henry van de Velde, Paul Hankar and Georges Hobé also participated.

In 1899 he entered into partnership with the French architect René Dulong and opened a branch of his business in Paris called *L'Art dans l'Habitation*. While Serrurier-Bovy's early furniture was characterized by rectilinear sobriety, his later designs were considerably more exuberant, employing the characteristic Art Nouveau line in a tense harmony with the weight of the mass. In 1898 his salon for the *Hôtel Chatham* in Paris was published in *Art et Décoration*, and at the celebrated World's Fair in Paris in 1900, he showed his own products, and designed the interior for Dulong's *Pavillon Bleu* restaurant. Stencilled arabesques on the walls were echoed in the elaborate form of the metal light fixture which was suspended from the ceiling and, somewhat incongruously, accompanied with white lacquer chairs. Through the late 1890s and around the turn of the century, he continued to exhibit at French salons. At the annual *Salon de l'Automobile*, held in Paris from 1904 to 1906, he showed prototype interior designs for three classes of hotels.

In 1901, he visited the *Dokument Deutscher Kunst* exhibition in Darmstadt, Germany, and wrote a critical two-part article in the Belgian cultural periodical *L'Art Moderne*. Serrurier-Bovy praised the overall effect and he favored the house of Hans Christiansen over designs by Joseph Maria Olbrich or Peter Behrens, but he criticized the project for its superficiality and absence of modern building materials, and moreover, disdained the luxuriousness of the installations. Instead, he admonished readers to "remain simple and sincere."

One of his most elaborate commissions was the small *Château de La Chapelle-en-Serval*, near Compiègne in northern France of 1902. In the tradition of the rustic hunting lodge, Serrurier-Bovy designed rooms for repose, comfort and the

quiet life of the countryside. Exchanging the whiplash curve associated with sophisticated urban projects for upright wooden settles in the vestibule and plain oak chairs with rush seats in the dining room, he created entire environments using friezes and murals that evoked the house's pastoral site. The walls of the billiard room at the *château* resembled a fairy-tale forest of birch trees, while the ceiling, the carpet and the delicate web of the iron chandelier contributed to the aestheticized naturalism of the ensemble.

From just after the turn of the century, he had been preoccupied with the design and construction of his own house in Cointe, a verdant site above the city of Liège. Completed in 1903, the *Villa l'Aube* became Serrurier-Bovy's definitive demonstration of the integration of art, architecture and decoration in the domestic environment. The large three-storey house was designed to accommodate family life and provide a three-dimensional realization of his ideas to visiting clients and friends. Each room was infused with a different color – a pale green in the dining room, a muted rust in the salon – that resonated throughout in the upholstered chairs, embroidered cloths, the floor mosaic, and in the ceiling and wall decoration. Serrurier-Bovy carefully controlled the details of the cabinetry and furniture to suit his needs, and for the music room he even had an upright piano constructed according to his own specifications. The house maintained a humble character appropriate to its site and in keeping with his social goals. After visiting the *Villa l'Aube*, socialist deputy Jules Destrée characterized Serrurier-Bovy as an "artiste artisan" and described the house as "a tangible affirmation of his efforts and hopes."

During the early years of the new century, Serrurier-Bovy's business faltered and then expanded when he added satellite shops in the Hague (1904) and in Nice (1907). If he became a prominent figure in business, he maintained his egalitarian notions of reuniting art with the largest possible public and designed a ready-to-assemble type of furniture for a model cottage at the World's Fair in Liège in 1905. This *Silex* design retained the upright, overtly functional characteristics of his earlier work, but also reflected a changing taste for straight lines rather than bulbous curves. At the Brussels World's Fair in 1910, Serrurier-Bovy again exhibited his own pavilion and contributed to other displays of wrought iron and wallpaper. However, on 16 November of the same year, he was struck with thrombosis and died three days later. Henry van de Velde, a fellow Belgian, continually credited Serrurier-Bovy not only for introducing English decorative art to Belgium, but for furthering the cause of modern architecture and design in continental Europe.

AMY F. OGATA

Biography

Gustave-Nicholas-Joseph Serrurier. Born in Liège, 27 July 1858, the son of a cabinet-maker. Studied architecture at the *Académie des Beaux-Arts*, Liège, from 1874; active as an architect from 1883 and as a designer of furniture and furnishings from c.1890. Visited England, 1884. Married Maria Bovy, 1884. Opened a shop specializing in interior decoration and English and American furniture in Liège, 1884; branches in Brussels, 1896, Paris, 1899 (in partnership with the architect René Dulong), The Hague, 1904, and Nice, 1907; established manufacturing workshops in Liège, 1899, and expanded into a large new factory and workshops on *rue de Joie*, Liège, 1907. Founder-member and President of the *Avant-Garde* group, Liège,

1901. Participated in several exhibitions including La Libre Esthétique Salon, Brussels, 1894 and 1895, Exposition Universelle, Paris, 1900, and Brussels, 1907 and 1910. Died in Liège, 19 November 1910; Serrurier et Cie. went into liquidation, 1918.

Selected Works

The Serrurier-Bovy archives containing designs, catalogues and archive photographs relating to Serrurier-Bovy and Serrurier et Cie. are in the Musée des Arts Décoratifs, Liège, which also owns examples of his furniture, lamps and ceramics. Additional examples of his furniture are in the Musée d'Orsay, Paris and the Musée Départemental de l'Oise à Beauvais.

Sèvres Porcelain

The porcelain factory of Sèvres is renowned for the flamboyant design and exquisite craftsmanship of its products. With its long association with French royalty during the last decades of the *ancien régime*, it represents one of the most illustrious traditions in the history of the decorative arts. Much of the factory's fame rests on the porcelain produced during its most vital and influential period in the 18th century, but its production has continued without break from its creation in the late 1730s up to the present day.

The factory was founded at Vincennes – hence the use of the term "Vincennes Sèvres" in some literature – and was renamed when it moved to Sèvres, west of Paris, in 1756. Louis XV was already the major shareholder when his mistress, the Marquise de Pompadour, persuaded him to buy the concern outright in 1759. It remained in royal hands until the French Revolution. Both Louis XV and Louis XVI took enormous personal interest in the factory, spending vast sums on items for display in the royal palaces and as private and official gifts. The majority of the factory's clientele came from the aristocracy and social elite, both in France and abroad, and included such foreign royalty as George IV of Britain and Catherine II of Russia.

Initially, the artistic inspiration came from the products of Meissen and China. In the early 1750s, with the appointment of Jean-Jacques Bachelier (1724–1805), there was a conscious move towards the development of a distinctive style that was more French in character and unique to the factory. This was made possible by the employment of the foremost French artistic talents, perhaps most significantly the goldsmith-sculptor-designer, Jean-Claude Duplessis (d. 1774) and the painter François Boucher (1703–70). While the famous soft-paste porcelain produced in the early part of the factory's history remained largely unchanged, research into a greater spectrum of colours, particularly ground colours for which the factory is famed, gilding techniques, shapes and the calibration of pieces through machinery, continued with ingenuity and success. Many of the results were new to porcelain production and made Sèvres the envy of Europe. The factory's range increased after 1768 with the introduction of the more heat-resistant hard-paste porcelain.

When the factory became state property in 1793, the staff was drastically reduced and porcelain production all but ceased. It regained its creative impetus in 1800 with the appointment of Alexandre Brongniart (1777–1847) as director, who abandoned the expensive soft-paste porcelain in 1804. Napoleon I's extensive patronage of Sèvres also contributed significantly to its renaissance. He often commissioned the most ambitious of the factory's projects, including large vases and tables set with porcelain plaques. Many of the products during this period were not essentially different from those of the previous century, but in addition to the Empire style with its preoccupation with Greek, Roman and Egyptian motifs, they also included exceptionally large pieces and the addition, for example, of columns and candelabra to the factory's repertoire.

As the century progressed, the factory capitalised on the renewed interest in the *ancien régime* by resurrecting past designs and manufacturing pastiches of fashionable 18th-century products. This encouraged a certain conservatism that

was in complete contrast to the dynamism of the previous century and that endured even with the adoption of new styles such as Art Nouveau and Art Deco. However, the turn of the 20th century saw a mixture of both the traditional and modern in the factory's output with the appointment in 1887 of Joseph-Théodore Deck as director; Deck introduced a range of new materials, including a stoneware for the production of architectural ornament. Sèvres has continued to manufacture simplified and modernised versions of 18th-century wares and products, some of which have been commissioned from eminent contemporary designers.

As well as those products that relate directly to the decoration of the interior, Sèvres produced many items that, although strictly useful in function (dinner services, tea wares, jugs and basins, ink stands, etc.) were also often displayed as objects of art. Sèvres porcelain featured in most of the rooms in Versailles and the other royal residences under Louis XV and Louis XVI. Mme. de Pompadour's Versailles apartment, for instance, included a bedroom with a set of five vases and matching wall lights. Candlesticks were also produced by the factory. It is likely that the porcelain products not only matched each other but also the furnishings of the room as a whole.

The factory's first major success lay in its exclusive right to make naturalistic porcelain flowers mounted on painted metal stems. These exquisite pieces were not only displayed in vases but also added to wall lights, lanterns and chandeliers. One particularly impressive ensemble of 1748, comprising a vase and two figurative groups in glazed white porcelain and a colourful bouquet of flowers (now in the Zwinger, Dresden), was given by the dauphine, Marie-Joseph to her father August III of Poland, Elector of Saxony.

Sèvres is perhaps unequalled in the seemingly endless creativity of its vases, some of which count among the most famous of the factory's products. These include the fabulously bizarre elephant-headed vases (*vases à tête d'éléphant*), examples of which are in the Wallace Collection, London, and Waddesdon Manor, Buckinghamshire. First produced in the 1750s, they combine a flower vase and candle holders. The variety of vases in the 18th century was enormous and numbered some 250 models for ornamental use alone, from voluptuous Rococo fantasies and exotic Chinoiserie to the urn-like shapes and classically inspired decoration of Neo-Classicism. Other types included pot-pourri vases, flower vases, and flower and bulb pots. Vases were not only sold singly but also in garnitures of three and five, making particularly grand displays on mantelpieces and furniture. Napoleon's lavish expenditure on Sèvres included several commissions for large vases; in 1812, his gift to the Emperor of Austria included two impressive ice pails now in the British Museum. Monumental vases were also produced later in the 19th century; two especially large Neo-Classical vases mounted in gilt-bronze are displayed in Brighton Museum, Sussex, dated 1863.

The factory had produced glazed and occasionally enamelled sculptural figures from the mid-1740s. These included an equestrian statuette of Louis XIV (1753) and white-glazed figurative clock-cases (1745–52), an example of which is in the British Museum. By the early 1750s, the production of biscuit (unglazed porcelain) figures had proved so successful that it all but replaced glazed porcelain sculpture. Occasionally the

figures were gilded (*biscuit doré*). The subjects were largely those also used in painted decoration, such as birds, pastoral and genre groups and sensuous mythological figures such as Venus, Cupid and Leda. Busts and portraits were also made, for example of Louis XV and Louis XVI, Queen Marie-Antoinette, and a seated figure of Molière. Many of the pieces produced in the 18th century were after designs or engravings by François Boucher, including the figure groups *La maîtresse d'école* and *Le sabot cassé*, both modelled by Etienne-Maurice Falconet (1716–91). Falconet was himself an important designer and sculptor, and the so-called *Baigneuse Falconet*, produced in biscuit form in 1758, had been exhibited as a marble sculpture at the French Academy the previous year. As with vases, garnitures of Sèvres figures were sold with matching bases and some were displayed as part of a decorative ensemble with Sèvres clockcases, such as the *colonne à pendule* which was introduced by 1771. Groups of figures also formed decorative centrepieces for tables and were sold with large services. A famous example is the 91-piece centre decoration consisting of a bust of Minerva surrounded by the Muses for the sumptuous 797-piece service made by Sèvres for Catherine II of Russia in 1778. Napoleon commissioned (as a divorce present!) a fabulous service for the Empress Josephine in which the central biscuit decoration forms an architectural fantasy based on three Egyptian temples (Apsley House, London).

Mounting porcelain plaques onto furniture began in the late 1750s and was reputedly the invention of the *marchand-mercier*, Simon-Phillippe Poirier. The practice became increasingly fashionable and continued into the 19th century. The furniture, often intended for ladies, was characteristically small and delicate, and plaques painted with floral sprays, genre scenes, pastorals and other scenes were added to a variety of items including secretaires, tables, music stands, coffers, clocks, inkstands, barometers, and even sedan chairs. They were made in many shapes and sizes, ranged from one to ninety on a single piece and could replace marble on the top of a small table. The designs were sometimes repeated in marquetry or lacquer, even matching the tea sets and useful wares. Some of the finest *ébénistes*, such as Adam Weisweiler (1744–1820) and Martin Carlin (c.1730–85) worked in this medium. Between 1766 and 1788, Carlin made porcelain-mounted furniture for Poirier, almost all of which was small-scale, and which amounted to one third of his total output. An exquisite example of his work is the *guéridon* dated 1774 which once belonged to Mme. du Barry and is now displayed in the Louvre. The table top has seven plaques which interconnect as a single surface and the central scene is taken from an engraving of 1766 after a painting of *Le Concert du Grand Sultan* by Carle van Loo. The table is an early instance of the grand presentation pieces that were to become fashionable in the next century when Sèvres exhibited designs at various international exhibitions, such as the Great Exhibition of 1851.

Mounting interest in English design and Neo-Classicism in the second half of the 18th century resulted in the fashion for imitation Wedgwood, and by the 1780s bas-reliefs and jasperware plaques were being added to furniture. In Marie-Antoinette's *salon de jeux* at Fontainebleau (1786) two commodes made by Guillaume Beneman (d.1811) are decorated with Sèvres jasperware medallions which match the over-

door panels and which contain classical figures painted in grisaille on a blue ground. Another example is the jewel-cabinet made by Jean-Ferdinand Schwerdfeger (active c.1760–90), again for Marie-Antoinette at Versailles (1787).

Brongniart's rejuvenation of Sèvres' fortunes in the first half of the 19th century included a range of furniture which exploited the larger plaques available as a result of the greater heat-resistance of the new hard-paste porcelain. The most impressive of these is the *secrétaire à bijoux* presented by Charles X to Francis I, King of the Two Sicilies, in 1830. Completed at Sèvres in 1826, it is covered in painted and gilded plaques and gilt-bronze mounts, all in a classical style, with two porcelain columns at the front corners of the lower section. The doors of the cabinet are mounted with two large plaques (73 inches high), designed and made by Jean-François Leroy (active 1816–44). These are decorated with Neo-Classical imagery, the central cameo designs surrounded by floral details, medallion heads and mythological figures on a vibrant pink ground. A modern relative of this genre is the cabinet in bright orange and black designed by Elizabeth Garoute and Mattia Bonetti in the collection of the Manufacture Nationale de Sèvres which includes a porcelain dish surmounting the cabinet.

During the 18th century, Sèvres virtually monopolised the market for plaques, the success of which led to the production of pieces which were framed and hung on the wall as works of art in their own right. Sèvres also produced a wide range of "paintings in porcelain" or *tableaux*, some borrowed from the oil paintings and cartoons at the Gobelins and others from the factory's own collection of engravings. These included portraits, still-lives, and hunting, pastoral, marine, mythological, classical and "Teniers" scenes. In Louis XVI's private dining room at Versailles, nine plaques from Oudry's cartoons of *Les Chasses du Roi* (framed 1782) were displayed. During the Empire and Restoration periods, Sèvres continued to produce a wide range of plaques decorated with designs after Old Masters and contemporary paintings. In the Second Empire, fascination for the *ancien régime* led to renewed interest in 18th-century French decorative arts, particularly in Sèvres, and resulted in the production of numerous pastiches of plaques as well as other products.

In the early part of the 20th century, the factory made greater efforts to modernise and to diversify its products in order to compete in a wider market. The *fin-de-siècle* saw an increase in glazed and painted forms of decoration for interiors and a range of household accessories. In the 1920s, this was developed further under the new directorship of Georges Lechevallier-Chevignard (director 1920–38) by utilising the talents of front-ranking artist-designers and architects such as Félix Aubert, Jacques-Emile Ruhlmann, Henri Rapin and René Lalique, most of whom were expert in areas outside the realm of ceramics. Although the following two decades for Sèvres are often viewed as somewhat lacklustre in comparison with other manufacturers, stylish and eye-catching designs were executed, above all for the various international exhibitions. The Exposition Internationale des Arts Décoratifs of 1925 served as a platform from which the factory showed off its versatility, with products in porcelain and other ceramics, including large decorative features for an interior. The two show pavilions contained panels for interior and exterior facing, richly enam-

elled statuary, fountains, basins, chandeliers, lampshades, illuminating doors and even ceiling panels. The wall decorations included *La Musique* by Anne-Marie Fontaine, while Rapin and Maurice Gensoli designed a range of translucent light-fittings for the *Salon de lumière* which featured Rapin's celebrated *fontaine lumineuse*. Other rooms included Lalique's impressive *Salle à manger* which was dominated by an Art Deco wall decoration in grey, silver and yellow showing a hunt scene in a stylised forest. Large decorations were also included in the Paris Exposition of 1937 where, in the *grande galerie*, two huge faience panels entitled *Le Tourneur* and *La Décoratrice* (after designs by Ossip Zadkine) each measured 3.2 metres long and 2.4 metres high. Although the market for such tours de forces has long since disappeared, the factory continues to produce high-quality porcelain and table wares.

CHRISTINE RIDING

Selected Collections

The largest collection of Sèvres porcelain is at Vincennes in the Collection Manufacture Nationale de Sèvres. Other important collections, including plaques for furniture and decorative objects used in interior decoration, are in the Musée des Arts Décoratifs, Paris and the château of Versailles; the Wallace Collection, London, and Waddesdon Manor, Buckinghamshire; and the Metropolitan Museum of Art, New York.

Shaker Design

"A place for everything and everything in its place," was the well known motto of the group that grew out of a Quaker sect in England to become a unique American community called the Shakers. Settled in nineteen communities by the middle of

Shaker room, 19th century

the 19th century, with a membership that peaked at over 6000 members by the Civil War, the Shakers were celibate, had limited contact with the outside world, and were dedicated to the sharing of all resources. Private property was abandoned, and simplicity and order were the guiding principles of daily life. Given the desire for self-sufficiency, the Shakers not only grew their own food and provided their own clothing, but began to create surplus products to trade for the window glass, sheets of tin, and other items they could not readily manufacture to their own standard. With order and simplicity being the bywords behind the creation of all objects, whether offered for sale or not, the Shakers soon developed a design concept and set of forms that still attract wide attention. Standardization became the tool for achieving order, and the pegboard, nested wooden boxes, and the flat broom could all be purchased in the knowledge that size, shape, and color could be predicted and assured.

The combination of simplicity and standardization produced what came to be known as classic Shaker forms, the chairs with cone-shaped finials, the woven rush seats, the three-legged candle stands and tables, the nested boxes with finger joinery and copper nails. Best known of all, and most

widely imitated, was the pegboard itself, designed to hold all of the lightweight furniture when it had to be removed for the daily cleaning of the rooms. The need for cleaning helped to shape both Shaker architecture and furniture. Every piece of extraneous ornamentation collected dust and added to the weight of the object, so simplicity became the order of the day. Whether chairs with holes for hanging, or buttonhole cutters that needed grasping, almost all Shaker designs contained the means for handling and storage. If the objects were too big to be hung out of the way, they were either put on wheels, or, when possible, built into the walls. Large shelves, folding beds, and cupboards were designed to fold or slide away from the floor space.

Many of the objects associated with Shaker design were invented to meet the needs of cleanliness and order. In particular, such objects as the flat broom, the boot scraper and mat, and the corner brush, all entered general use by way of the Shakers. Lidded drawers, table swifts (for winding yarn), and multi-use furniture like table desks, were also manifestations of the Shaker demand for order and practicality. Even the tools used to make taffy, core apples and line sheet music can be easily identified as of Shaker design, as are the forms and

moulds used to make candles, boxes, and even woollen gloves. The nested boxes were not the only storage form that achieved wide popularity; Shaker sewing baskets, pasteboard boxes, and woven baskets are as much in demand today as they were in the middle of the 19th century.

The Shakers favored certain materials and ways of working, and maintained handmade traditions while embracing standardization of size and shape. Cherry and maple were favored hardwoods used in furniture making; the thinly planed pieces were steamed so that they could be curved into the desired shapes without cracking, and the shape of each desk, chair, or table was adapted to specific use. Depending on use, a chair might be all wood or rush seated, with or without drawers or footrests, and serve as a rocker, apple-sorting chair, dining room or desk chair. In order to avoid rusting and loosening, the furniture was usually constructed with wooden pegs that could be readily tightened, or with copper nails when such a form of joining was necessary. Paint was seldom used, and only grain-revealing stains were used to preserve and protect the wood.

Certain elements of exterior design, such as the round Shaker barn that replicates the form of the nested box, the fences that reflect the joining of their chairs, and tools for agriculture were designed with shapes similar to those of items for domestic use. All of these elements are integrated into the whole of Shaker design, recognized as both practical and appealing since they were first offered for sale to obtain ready cash for necessary purchases. But when manufactured goods began to cost sufficiently less than the Shaker handmade article, demand began to diminish. Rather than compromise on quality, each financially unsuccessful product was dropped in turn, leaving mostly medicines, packaged seeds, and various specialty items as the only viable items for sale. With a declining membership population by the end of the 19th century, Shakers began buying more of what they needed from the outside world, and their creative design came to almost a complete halt.

As folk design and indigenous art of all types became popular in the 1930s, Shaker design enjoyed a renaissance that was reflected in the furniture and furnishings being avidly collected. By the 1950s, interest in both general Shaker design and specific forms created a Shaker revival, with craftsmen adopting and adapting the Shaker aesthetic to both traditional and new sorts of objects. Commercial companies also began to create furniture inspired by the Shakers, ironically manufacturing the very forms that the rise of industrial America had eradicated. European furniture design adopted the Shaker interest in simplicity and lightweight adaptability, reflected in many Scandinavian designs of the 1960s and later. The overall Shaker design aesthetic is universally recognized as both a truly indigenous American form of design and the first unified design sense that substituted function and simple beauty for applied ornamentation and historical references.

DAVID M. SOKOL

Selected Collections

Large collections of Shaker furniture are in the Shaker Museum, Hancock, Massachusetts, and the Shelburne Museum, Shelburne, Vermont. The Shaker cultural and religious heritage is preserved in the Shaker Village, Canterbury, New Hampshire.

Shaw, Richard Norman 1831–1912

British architect and designer

Richard Norman Shaw was one of the most prolific and highly regarded British architects of the second half of the 19th century. According to *The Builder* “scarcely anything from his hand can be without interest” and, working in a period that favoured the architect-designer, he was responsible not only for a vast number of urban and rural domestic residences and commercial buildings but also for the design of many notable interiors and furnishings. He worked in many different styles during the course of his long career, but his name is chiefly associated with the “Old English” and Queen Anne styles which he developed during the 1860s and 1870s. Both styles had a decisive impact on progressive taste during the late Victorian period and exercised an important influence on architecture and design in parts of Europe and America.

Shaw trained as an architect in Edinburgh, and later at the Royal Academy in London where he was awarded silver and gold medals and a travelling studentship between 1852 and 1854. At the age of eighteen he entered the studio of William Burn. After extensive travel in Europe (1854–56) he worked for the Gothic revivalist architect G.E. Street, succeeding Philip Webb as principal assistant in 1859. During this period Shaw also began to design furniture and he exhibited a desk the revealed construction, geometric inlay and stump columns of

Shaw: library, Cragside, Northumberland, 1870–85

which were typical of the Reformed Gothic style at the International Exhibition of 1862. Having left Street's office in 1862, he shared an office with W.E. Nesfield (1835–88) from 1863, and the two worked in partnership between 1866 and 1869. In 1870 he set up his own hugely successful architecture and design studio and his pupils included several notable designers, such as W. R. Lethaby, who later formed the nucleus of the Art Workers' Guild (established 1884). In this way Shaw was closely connected to many figures in the Arts and Crafts movement.

Shaw's early architectural commissions, such as Bingley Church (1866–68), were executed in the Gothic style, but by the late 1860s his range of historic references had moved forward to the vernacular buildings of the 16th and 17th centuries as he evolved his version of the Old English or Shavian Manorial style. This style is evident in many of his country houses, particularly Leyswood House, Sussex (1866–69) and Cragside, Northumberland (1870–85). During the 1870s, he also developed the Queen Anne style which he deemed especially suitable for urban settings and which is exemplified in his London commissions such as Old Swan House, Chelsea (1875–77), Luke Fildes house, Kensington (1875–76) and the numerous small houses that he designed in Bedford Park (1877–80). From the 1880s he favoured the neo-Baroque style but the virtuosity and versatility of his talents

has meant that his work is both too eclectic and too independent to categorise exactly.

The essence of both the Old English and Queen Anne styles was their use of picturesque massing and asymmetrical ground plans, both of which made for complex interior spaces. Shaw's Old English houses, in particular, seem to have been built by accretion with rooms of different heights and shapes arranged at different levels, and his use of mixed stylistic references gave the appearance of old homes that had been added to gradually over several years. Oblique wings and irregular fenestration are characteristic of his plans; Cragside, for example, boasts a variety of gabled and crenellated towers and, like less ambitious projects, involves various internal levels with attendant stairs, mezzanines and galleries.

Many of Shaw's buildings also reintroduced the idea of the Great Hall as a living space into 19th-century interiors. Inspired by medieval, Tudor and Jacobean examples, Shaw's conception of the Living Hall related to its use in medieval times when it served as the principal living space within great houses or manorial homes. It marked the beginning of a move away from the High Victorian practice of providing a separate room for each domestic function towards more open planning. Placed at the centre of the house and rising up through several floors, Shaw's halls not only provided a useful focus for the architecture of his buildings but also served as the social heart

of his interiors. They were generally comfortably furnished with upholstered seating, rugs and heavy wood furniture and contained vast, welcoming fireplaces. A minstrels' gallery might provide an upstairs vantage point and they acted as both summer sitting rooms or a space where the family and their guests could gather for larger entertainments during the rest of the year. Encouraged by a nostalgia for a simpler, more hospitable style of domestic life, the Living Hall became an important feature of English and American country houses during the last decades of the 19th century and was developed further in the work of other Arts and Crafts architects and designers.

Shaw was also especially fond of inglenooks to add to the sense of cosiness within his houses, and examples survive at both Leyswood and Cragside. It has been suggested that the use of inglenooks within Victorian houses was a gendered device, as they were usually adopted in traditionally masculine areas such as billiard, smoking and gun rooms (Harper, 1988). But they were also inherently homely features, containing settles and cushions, and occasionally dedicated windows. They also provided an enclosed area adjacent to the fireside that was protected from draughts and were thus well-suited to the British climate. Shaw's appreciation of this fact is another example of the way in which he appropriated the more practical aspects of vernacular architecture within his interiors.

As with his architecture, Shaw's approach to decoration was additive. "The 'decoration'", he wrote, "will come, all in good time, little bit by little bit, and much better done if carefully and slowly evolved", and he favoured the eclectic mixing of exotic and historical styles that was typical of many fashionable Aesthetic interiors during the 1870s and 1880s. Fireplaces, sometimes deeply recessed, and often incorporating shelves for the display of the popular blue and white china, were always central to his interiors as was the use of fitted furniture, and rich panelled woodwork for the walls, doors and even ceilings. He also liked to use tiles and panels of stained glass to provide accents of colour; the fireplace in the front drawing room of his own house at 6 Ellerdale Road, Hampstead, was decorated with De Morgan tiles, the inglenook in the dining room at Cragside contained stained glass designed by Edward Burne Jones while the staircase to the gallery was entirely clad in tiles of Moresque design.

Several of Shaw's most important interiors, such as Old Swan House built for Wickham Flowers in 1875, included decorations by Morris & Co., and, like Morris, Shaw played a leading role in the promotion of more Artistic styles of decoration in the last decades of the 19th century. There were, however, important differences between the two. Both, for example, liked to use wallhangings and tapestries but Shaw became increasingly unsympathetic to Morris's fondness for mixing boldly patterned textiles, wallpapers and painted decoration. He criticised the "present-day belief that good design consists of pattern – pattern repeated *ad nauseam* – [as] an outrage on good taste" and his celebrated description of Morris as "a great man who somehow delighted in glaring wallpapers" suggests the gulf that had grown up between them.

Many elements of Shaw's interiors were designed or made by his assistants. Lethaby, for example, was responsible for much of the interior detailing at Cragside, including the

magnificent fireplace in the drawing room, while W.H. Lascelles and J. Aldam Heaton executed many of his designs for furniture. Shaw's mature furniture combined Gothic with newly fashionable oriental styles and employed techniques such as lacquer, ebonising and incising. He was probably influenced by Nesfield's pioneering use of Japanese motifs but he was also an avid collector of blue-and-white porcelain which suggests a strong personal interest in oriental forms. The library at Cragside includes a set of stylish ebonised chairs with gilded leather backs that are strongly reminiscent of E.W. Godwin's Anglo-Japanese designs, while later examples of his furniture, although not overly distinguished, appear to be consistent with other Art furniture of the period. It is often difficult to establish the extent to which Shaw was involved in the interiors and decorations for his buildings. He undoubtedly exercised overall control of the work that was put out by his office but, as his assistants became more proficient in interior design, he increasingly devoted himself solely to the planning and structure of his buildings.

Although stylistically retrospective, Shaw's work contained much that was new and modern. His emphasis upon open-planning, simplicity and lightness, and his use of materials such as concrete, iron and steel were all quite innovative. Even in his most "backward-looking" buildings he was careful to consider modern comfort and convenience as well as picturesqueness – and Cragside incorporated electric light and central heating behind its rambling fortified façade. Many of Shaw's plans and drawings were regularly published in the architectural press and his influence in America and on the Continent was substantial. The German critic Hermann Muthesius described him as a "great architect [who] touched every nerve of his age with a beneficent hand" and, while his work is central to an understanding of late Victorian architecture and design, his encouragement of informality heralded many of the concerns of 20th-century living.

Biography

Born in Edinburgh, Scotland, 1831. Educated in Edinburgh; attended the Royal Academy Schools, London; awarded Royal Academy Silver and Gold Medals. Articled to William Burn, London, c.1849. Travelled to Belgium, France, Germany and Italy, 1854–56. Entered the office of Anthony Salvin, 1856; chief clerk in the office of G.E. Street, 1859–62. Practised independently as an architect, London, from 1862; in partnership with W.E. Nesfield, 1866–69; established his own studio, 1870. Designed furniture from early 1860s. Pupils included W.R. Lethaby. Member, Royal Academy, 1877. Refused a knighthood. Died in London, 17 November 1912.

Selected Works

A large collection of Shaw's drawings is in the Drawings Collection of the Royal Institute of British Architects, London. Examples of his furniture survive *in situ* at Cragside, Northumberland.

Interiors

- 1866–69 Leyswood House, Groombridge, Sussex (building and interior fittings)
- 1870–72 Grims Dyke, Harrow Weald, London (building and interior fittings)
- 1870–85 Cragside, Northumberland (building, interiors and furniture; with W.R. Lethaby)

- 1873–75 Lowther Lodge, Kensington Gore, London (building and interior fittings)
- 1875–76 8 Melbury Road, Kensington, London (building and interior fittings)
- 1875–76 6 Ellerdale Road, Hampstead, London (building, interiors and furniture)
- 1875–77 Old Swan House, Chelsea, London (building and interior fittings; decorated by Morris & Co.)
- 1876–81 Adcote, Shropshire (building and interior fittings)
- 1877–80 Bedford Park Estate, Chiswick, London (24–35 Woodstock Road and Tabard Inn; buildings and interior fittings)
- 1878–83 Flete, Devon (building and interior fittings): Henry Mildmay

Much of Shaw's later work consisted solely of designs for exteriors and ground plans. His furniture was made by W.H. Lascelles and J. Aldam Heaton. Shaw also designed cast-iron fireplaces for Coalbrookdale and Elsleys.

Shchusev, A.V. 1873–1949

Russian architect

A.V. Shchusev was an architect whose work spanned two different eras, separated by the October Revolution of 1917; he worked successfully both in the final years of the Russian Empire and during the Soviet period. At the beginning of the 20th century, Shchusev emerged as one of the leaders of a national revival (the "Neo-Russian style"). In the main, he built orthodox churches, reviving and interpreting in his own original way the architectural forms of ancient Novgorod and Pskov, as well as those of old Moscow. Shchusev's contemporaries held his churches in high regard, appreciating their national spirit, austere decoration and unique poetic qualities. After the October Revolution, Shchusev was responsible for designing Lenin's Mausoleum in Red Square – a building of great ideological significance. It was this commission which largely determined Shchusev's position as the leading official architect of the Stalinist era.

From the 1930s onwards, having experimented with Constructivism, Shchusev set out to master the classical heritage in architecture. He took this course of action, which was consolidated by official party resolutions, so that the grandeur of the Stalinist era and the might of the Soviet Socialist system could be embodied in its architecture. Shchusev's aim was neither to modernise classical architecture nor to create a retrospective style. Rather he came to represent an eclectic version of a traditionalist type of architecture with a strong inclination towards decoration. Keenly aware of the problem of establishing national originality in architecture, Shchusev sought to realise one of the fundamental ideas underlying the "method of socialist realism": the unity of a national form with a Socialist content. Four times the Stalin Prize Laureate (then the highest recognition for creative and scientific achievements), Shchusev was one of the founders of the formal and sumptuously decorated façades of the Stalinist empire.

Shchusev's earliest work was on church interiors in the ancient Kiev-Pechersky lavra, designing an iconostasis in the Byzantine style and ornamental paintings (1902–03). He also built the Church of the Trinity in the Pochaevsky lavra (1906–11). The church was built in the austere style of Novgorod monuments of the 11th and 12th centuries and was majestic in its simplicity. The wall paintings, iconostasis and ceramic stoves all imitated ancient Russian art, but showed traces of the influence of the Art Nouveau style. The Cloisters of Martha and Mary, built between 1908 and 1912 from Shchusev's designs, evoked memories of Novgorod-Pskovian and early Moscow forms. With one dome and a large vestibule, the church is almost sculptural in its sense of mass and has a complex and dynamic structure to its internal space. Massive arches form the main leitmotif of the interior. The sensation of movement, of the internal spaces flowing into one another (a feature of Art Nouveau architecture) combines with an impression of archaic severity. The lapidary white surfaces of the walls, vaults and arches contrast with the ecstatic, almost incorporeal forms painted by the famous religious artist, M.V. Nesterov.

Shchusev's greatest achievement was the Kazan Station in

Moscow (1913–26). The building's asymmetrical composition, with rich patterned details, kept to the style of Moscow architecture at the end of the 17th century. Everything inside was designed on a large scale; the arches and vaults established a play of powerful lines, and different perspectives were created as the various halls merged one into another. The latest reinforced concrete structures were used in the construction of the station (the engineer was A.F. Loleight). The system of load-bearing arches above the covered "warm" platform was particularly significant. It enabled stepped vaults to be built not unlike those found in ancient Russian architecture. The high, star-shaped ribbed vault above the eight-sided hall evokes associations with the late Gothic style. Shchusev's plan was to have a vast monumental painting as the main element of the station's interior, but this idea was only partially realised at a much later date when the artist E.E. Lancere painted a panel for the restaurant and the main waiting room in the 1930s and 1940s. The huge hall which houses the restaurant, with its high vault and tall windows, has very precise architectonic features but over-exuberant decoration. Intricate stucco patterns, which evoke the Baroque style, weave their way turbulently along the walls. The Kazan Station marked the highpoint of Shchusev's career as an interior designer.

The State Hall of Mourning in the Lenin Mausoleum (1929–30), which houses the glass coffin and the embalmed body of Lenin, is cubic in form with a stepped ceiling. The interior is sparsely decorated and full of a strict sense of ceremony. The walls of the hall are faced with black and grey labradorite interspersed with red porphyritic pilasters. A frieze of purple smalt with a stylised drawing of lowered banners accompanies the movement of people as they file past the coffin.

At the end of the 1920s and beginning of the 1930s, Shchusev designed a number of buildings in the Constructivist style. The organisation of their internal spaces and the design of the interiors and furnishings corresponded to the principles of Functionalism. But Shchusev subsequently returned to a more traditionalist and decorative style. For the Hotel Moskva, which was built right in the centre of the capital (1931–35), a reinforced concrete framework was dressed in classical clothing. Stucco moulding and ornamental paintings were used extensively as part of the hotel's interior design, as was quality wood, marble and bronze. Particular attention was paid to the valets' quarters, where all the furniture was made from specific designs. It was here that the so-called "culture of trivia", which was to play an important part in Shchusev's creative method, first appeared.

A desire to unite classical compositional methods with national characteristics is a typical feature of the Institute of Marx, Engels and Lenin in Tbilisi (the capital of Georgia) and of the Alisher Navoy Theatre of Opera and Ballet in Tashkent (the capital of Uzbekistan). Classical methods and forms have been transformed within the spirit of old Georgian architecture on the Institute's façades and within its interiors (1935–38), where local materials have been used and original ethnic details introduced. In point of fact, the building is an example of skilful eclecticism.

National characteristics are evident to an even greater degree in the Tashkent theatre building (1938–47). Here the tendency of Stalinist architecture towards decoration and saturated detailing coincides with the opulent patterns that are

traditional in buildings in Central Asia. The theatre's interior, completed by a number of Uzbek artists, is like an entire world devoted to folklore decoration. Central Asian motifs are clearly evident in the detailing around the doors and windows, in the frames of the niches and panels, the carvings on the doors, and in the drawings of chandeliers and the minute details on the furniture which was made from sketches by Shchusev. He used a whole variety of decorative materials: marble and locally carved "ganch", as well as wood and metal. Painted panels were very important in the interior design – Shchusev always believed in painting as part of architecture. The rooms inside the theatre are linked by broad arches, through which various perspectives open up. The building itself is the realisation of Shchusev's propensity for dramatic spatial effects.

Shchusev's final commission, completed after his death, was the Komsomolskaya-Koltsevaya Metro Station in Moscow (1949–51) whose interiors returned to the opulence which Shchusev had used earlier in the Railway Restaurant opposite the Kazan Station. The underground station is transformed into a triumphal memorial to the victory in World War II. The mosaic by P.D. Korin in the vault is dedicated to Russian military feats past and present. Shchusev's motto of "a joyful monumentality" is epitomised in the metro station's bright and buoyant decoration. However, for all Shchusev's skill and undoubted sincerity, the signs of a decline in his style are already apparent, and it was eventually to degenerate into an academic eclecticism. The metro station marked the culmination of Shchusev's architectural achievements and, to a significant degree, of the entire "Stalinist Empire style".

BORIS KIRIKOV
translated by Charlotte Combes

Biography

Aleksei Viktorovich Shchusev. Born in Kishinev, Russia, 26 September 1873. Studied under L. N. Benoit at the Academy of Arts, St. Petersburg, 1891–97; awarded travelling scholarships, in Russia 1894, and abroad, 1897. Married Maria Vikentievna Karchevskaya, 1897: children included the engineer, Mikhail Shchusev (1908–78). Active as an architect in St. Petersburg, from c.1898, and in Moscow, from after 1905. Joint head with Ivan V. Zholtovsky, of the architectural studio of Mossovet, 1918–21. Taught at the Higher State Art and Technical Studios, Moscow, 1918–24. Head of the urban design studio "New Moscow", 1921–23. Wrote extensively on design and architecture. Member, Academy of Arts, Moscow, 1910; President of the Moscow Architectural Association, 1921–29; Director of the Tretyakov Gallery, Moscow, 1926–29; head of the Second Architectural Mossoviet, 1932–37. Recipient of numerous honours including 4 Stalin awards. Died in Moscow, 24 May 1949.

Selected Works

The main collection of Shchusev's drawings and documentation relating to his work are in the Shchusev Museum of Architecture, Moscow.

Interiors

- 1906–11 Church of the Trinity, Pochaev (building and interiors)
- 1908–12 Cloisters of Martha and Mary, Moscow (building and interiors)
- 1913–14 Russian Pavilion, 11th Biennale, Venice (building and interiors)
- 1913–26 Kazan Railroad Station, Moscow (building and interior layout)

- 1924 & Lenin's Mausoleum, Moscow (temporary
- 1929–30 mausoleum, 1924; permanent mausoleum, 1929–30)
- 1928–33 Commissariat of Agriculture, Moscow (building and interiors)
- 1931–35 Hotel Moskva, Moscow (building and interiors; with L.I. Sarveliev and O.A. Stapran)
- 1935–38 Institute of Marx, Engels and Lenin, Tbilisi, Georgia (building and interiors)
- 1935–49 Academy of Sciences Complex, Moscow (partially completed)
- 1938–47 Theatre, Tashkent, Uzbekistan (building and interiors)
- 1938–47 Alisher Navoi theatre, Tashkent, Uzbekistan (building and interiors)
- 1949–51 Komsomolskaya Metro Station, Moscow (building and interiors)

Shekhtel, F. O. 1859–1926

Russian architect and designer

F. O. Shekhtel was a leading exponent of the Art Nouveau style in Russia and an innovator in late 19th and early 20th century Russian interior design. Paying particular attention to the spatial organisation of his interiors, Shekhtel made his own studies of paintings and stained-glass panels, as well as sketches for fabric and wallpaper designs; he also designed furniture, china and everyday objects.

Shekhtel's creative energies were mainly centred around Moscow. He started to work independently at the end of the 1870s and had developed his own inimitable style by the 1880s. The interiors of private houses and public buildings, based on his designs, were widely imitated.

Shekhtel's early period was characterized by works executed in the Gothic manner. His work for the private home of Z. G. Morozova (1893) first brought him public recognition and

established him as one of the leading exponents of interior design in Russia.

The new method of design "from the inside out", where it was the plan itself which determined the composition of a building's façades, meant that the emphasis was taken away from the external appearance of a building in favour of its spatial structure and interior design. Shekhtel's innovation lay in his creation of a systematic and dynamic spatial structure that was compact and that could be changed, in contrast to the linear and functional design of earlier interiors.

The various groups of main rooms, living and servants' quarters are kept separate from one another. Although Shekhtel includes corridors in the children's rooms and living quarters, and suites for some of the main rooms, they have been subjected to a new principle which seeks to unite the spaces in a building and according to which the compositional nucleus lies in the hall, inner hall and the main staircase which link all the other parts of the house.

His interiors were treated like spectacular pictures replacing each other in a continuous movement around the house. First and foremost, spatial correlations, together with colour and light, determine their beauty and expressive qualities. Sources of light, both natural and artificial, became one of the most effective compositional means of expression employed by Shekhtel. The positioning of the windows, their shape and size, all emphasize the scale of the rooms; panes of coloured glass radiate a stream of light into the rooms controlling its intensity and lending greater expression to the alternate lit and shaded spaces. Through their colour and light, the windows and different light fittings constitute a fundamental part of the whole, uniquely diverse, ensemble.

Shekhtel's interiors are full of works of art: painted and stained-glass panels as well as sculptural groups. He worked with the artist M. A. Vrubel' and was able to create an appropriate setting for his works – a stained-glass panel from a drawing by Vrubel' in the main staircase window and the sculptural group *Robert and the Nuns* at the foot of the stairs are not only displayed in, but fuse with an architectural environment designed specifically for them. Vrubel' completed three decorative panels on the theme of Times of the Day for one of the rooms in the private house. Their strict architectonic composition is inseparable from the architectural solution and the articulation of the room's own walls and windows.

The private home of Z. G. Morozova is a masterpiece of Shekhtel's work in the early 1890s. Created at the watershed of two stylistic epochs, it has many features of a transitional period – the desire to make decorative forms more organic combines with a reliance on a number of historical styles: the Rococo drawing rooms and the classical forms of the White hall must have contrasted quite effectively with the Gothic style elsewhere.

Shekhtel continued to develop his Gothic theme in other works from this period. He joined forces with Vrubel' once again to decorate the study and reception room in A. V. Morozova's home (1895), designed to house his collection of paintings. The Gothic details which decorate the study are highly stylized (the wooden carvings on the wall panels and stairs leading to the attic, the sculpted figures of the chimaera and the monsters) and match the style of Vrubel's four panels on the theme of Faust. Framed in dark wood, they literally

Shekhtel: Gothic study, A. V. Morosova house, Moscow, c.1895

merge with the wall and exhibit the same broken rhythms and dark colouring as other elements of the interior decoration.

Shekhtel's Gothic style – one of the most remarkable aspects of the architecture of the 1890s, was the earliest movement in the transition from the eclectic to the Modern or Art Nouveau style in Russia. All the innovative methods which subsequently formed part of the Modern Style are to be found in miniature in Shekhtel's own home (1896), where all signs of a Gothic influence were banished. The house's internal space is designed around the contrasts and organic interrelation of all the internal volumes, each of which establishes its own plastic composition on the outside. The wooden main staircase, which links the two storeys in the house, visually embodies the unity of the internal spaces and forms the axis of the entire three-dimensional spatial composition. The interior spaces are opened up to the outside and to one another. In contrast to Shekhtel's earlier works, problems concerning the internal space of this house, the original of which no longer remains, were resolved along purely architectural lines – the use of different *faktura* (textures) and decorative materials, the dynamic treatment of the spaces and the effects of natural and artificial lighting are virtually the only means of expression.

The characteristics of the Modern Style were fully realized in the house of the banker S.P. Ryabushinsky (1900–02), acknowledged as Shekhtel's masterpiece. The main rooms are concentrated around a geometric and compositional nucleus of interiors, with the open main staircase flowing like an undu-

lating wave up to the second floor and uniting it with the space below. Each room in the house is connected with the rest of the building and yet, at the same time, can also be completely cut off, connecting with other rooms via the staircase's landing. The translucent planes of the stained glass windows create a sensation of duality and uncertainty, with the rooms simultaneously seeming to merge with and separate from the external space outside the building. Shekhtel paid even more attention to the furniture in the house, to the electric light fittings and all the domestic details right down to the door handles. The theme of waves and nautical verse predominates in the decoration of the main staircase and the dining room; it can be seen in the silhouette of the marble parapet on the staircase's bannister and in the design of the parquet flooring, with the same motif repeated in the mural on the dining room's walls. The interior design of Ryabushinsky's house is excessively decorative with an emphasis not so much on the new motifs of Art Nouveau, but rather on the new ways in which they were applied – methods which involved asymmetry, staggered complex rhythms, the three-dimensional nature of the superimposed decor, and bold painted strokes.

In Shekhtel's next great project, A.I. Derozhinsky's house (1901–02), the interior design is more discreet and the individual elements are more significant. The building's design is typical of Shekhtel. All the rooms are grouped around the main staircase, but the compositional centre of the building is a huge two-tiered hall, into which all the main rooms on the first floor open: the vestibule, drawing room, dining room and the study. Vast forms predominate in the immense proportions of this hall. Clusters of lamps, like pearls, hang from the ceiling on delicate metal threads of differing lengths. A pattern of broken spiralling scrolls on the fence outside is repeated in the building's interior design – in the furniture upholstery, the metal lattice-work of the chandeliers, the stencilled paintings on the walls and other upholstery fabrics reproduced from Shekhtel's own sketches. The new furniture, where form is conditioned by function, is extremely comfortable. Above all, Shekhtel accentuates the expressive qualities inherent in each object, just as he does when planning a building's façades: texture, colour and decor merely supplement the expressive nature of each object's constructive base. Each and every decorative element is made significant because of the pure and uncluttered style of the room's interior design. The cult of the well-designed interior, to which Shekhtel adhered, found its expression in a desire to make every detail of an interior part of the whole ensemble – expedient, beautiful, hygienic and comfortable.

During the 1900s, Shekhtel worked mainly on public buildings where he applied with greater consistency the rationalist tendencies that had appeared in his work of the earlier period. His work on the interior design of the Moscow Arts Theatre (1902) evoked a significant response partly because of the "vocal" nature of the plan of the building, where the auditorium "flows into" the huge bay of the stage. The main body of rooms is surrounded by a number of subsidiary rooms. Those for the audience are situated on the side of the building which faces the street – the foyer, buffet, cloakrooms and ticket office; the workrooms face the courtyard at the back (the actors' dressing rooms, storerooms for props, etc.). Despite the modest decoration and the restrained nature of the paintings, the delicate frosted lamps, simple furniture and soft carpeting,

art and sculpture do have an important role to play. Their main theme – that of the wave – greets the audience as soon as they arrive at the theatre in a sculptural composition by A.S. Golubnika: the faces of the swimmers barely show through the rushing expanse of water. The simple light grey canvas curtain is decorated at the bottom with a broad band of appliqué work with the same stylized motif. And the white dove, which appears on a number of decorative panels, was to become the symbol of the theatre.

The interior decor of the Yaroslav Station (1906) contrasts with the paintings on its façades. The straight lines of the light fittings and the delicate pattern on the glass doors echo the smooth walls of the Waiting Room, decorated at the top with a panel by K.A. Korovin.

Shekhtel's own house (1909) shows the architect turning to forms from the Russian Empire style. As part of this, he retains the free construction of the plan and its close interaction with the three-dimensional and spatial composition of the building. The nucleus of the house is a two-tiered hall with a large window overlooking the street. Shekhtel turned to the classical heritage in his work while at the same time reinforcing rationalistic characteristics, and these were most noticeable in banks and office buildings.

Many principles of the new architecture were first conceived in buildings such as the Ryabushinsky Bank (1903), the printing works of the *Utro Rossii* newspaper (1909) and the Headquarters of the Moscow Merchants' Society (1909). The main compositional and decorative method used for their interiors was a framework construction which was given an artistic interpretation. A framework of reinforced concrete meant that the inside of the building could be planned quite freely and yet could also be changed with simple partitions. This allowed for the integration and transformation of the internal spaces. Traditional decor was rejected, a few functional architectural elements were retained and more windows were included with fewer piers between them. This meant that the whole construction was "exposed" within ascetic interiors seeking maximum simplicity and that the three-dimensional forms themselves articulated the internal spaces. The texture and colour of the materials, their contrasts and comparisons, became the most important means of expressing the vast uniform surfaces. Increasing the number of windows meant that not only the lighting of the rooms improved, but also that the whole role played by glass in interior design underwent a radical change: the different proportions of the windows, their checked transoms and the facets on the brilliant plate glass introduced a new diversity to their ascetic design.

Shekhtel continued to work into the 1920s, but his designs for private houses and public buildings of the 1890s and 1900s remain his greatest achievement.

Sheraton, Thomas 1751-1806

British cabinet-maker and designer

Thomas Sheraton, like George Hepplewhite a few years before him, has given his name to a style of furniture that has remained consistently popular as an example of middle-class taste. Although a cabinet-maker, his trade as a drawing master specialising in furniture design and perspective meant that he was influential not only through his publications but also via his pupils.

Sheraton's first furniture work was published in parts

between 1791 and 1793 as *The Cabinet-Maker and Upholsterer's Drawing Book*. A combined volume was issued as a second edition in 1794. Sheraton was quite clear as to the *Drawing Book's* purpose: it was designed "to exhibit the present taste of furniture, and at the same time to give the workman some assistance". Its value lies in the illustrations of the then-current state of English taste, as well as in the extensive technical detail which gives insights into trade practices. Indeed, of his 600 or so subscribers, almost all of them were associated with the trade. A third English edition was published in 1802.

In 1803 the *Cabinet Dictionary* was published, the first compilation of details of the Regency style and one of the earliest responses to the archaeological approach to furniture design that was becoming fashionable. Sheraton's application of these new motifs is sometimes strange but shows a deliberate desire to introduce elements of style into his designs. As a vocabulary of taste and style in house furnishings of the time it is unrivalled.

In 1805 he began *The Cabinet-Maker, Upholsterer and*

Sheraton: drawing room plan and section, 1793

General Artist's Encyclopaedia but only managed to complete the section A-C. This continued the vein for fashionable designs, but its influence was likely to have been limited. Sheraton died in 1806, but in 1812 a selection of 84 designs from his previous works were re-issued under the title of *Designs for Household Furniture*.

His early style reflected the apogee of Adamesque Neo-Classical detail, but with his own simpler and severer outlines, which were combined with elegant flat decoration. This often took the form of stringing and of patterns produced in veneers. In other circumstances, there was less use of pure Neo-Classical ornament and rather more of painted figure and natural floral subjects. The use of satinwood as a fashionable timber also became important as Sheraton promoted it for its "cool light and pleasing effect in furniture".

A particular characteristic of many of his designs was the continuation of a colonnette or leg from the base to the top of an object interrupting the mouldings, seat rails or table top so as to create a tension within the design.

In his later work, the French influence was evident, showing an affinity with products from the Louis XVI reign. This is not surprising as the emigration of many French makers during the Revolution directly influenced their London counterparts. The French influence manifested itself in a delicate richness which was expressed in examples of Sheraton furniture. Designs such as break-front table tops with serpentine fronts, and the delicate scrolling of flower and leaf patterns, were combined with ribbon decoration. The adaptation of French turned legs in the form of spinning tops as supports for cabinets and chests was also typical. The anglicisation of the Parisian taste of the 1780s perhaps meant that Sheraton had a tendency towards over-elaboration and femininity in his designs, especially of drapery and upholstery.

Another influence appeared to be the work of Henry Holland. The *Drawing Book* illustrates the Prince of Wales's Chinese drawing room at Carlton House, while Sheraton also shows a design for a main drawing room, itself a composition based on Carlton House and the Duke of York's residence.

One of his most important contributions was the introduction of new forms of furniture. The sofa table, the pedestal dining table, the D-shaped writing table, and the Carlton House table are all associated with Sheraton. Like Hepplewhite, Sheraton also featured chairs in his work; these had fine shapes with square backs, thin splats and front legs either in carved mahogany, painted, or japanned, sometimes with caned seats, all of which are identified with Sheraton.

Other furniture features included domed tops to ladies' writing tables, dressing tables and occasional furniture. These were a welcome contrast to many of the square or rectangular forms mainly found in his first publication. Although he intended to offer examples of the current taste he was also interested in inventions of his own, such as chairs with circular seats, extremely curved sofas, elliptical beds, and various items of mechanical furniture.

His ability to reflect contemporary taste is shown in his designs in the *Cabinet Dictionary*, where a Grecian couch with scrolled ends and lion's paw feet is depicted, while in the *Encyclopaedia* there is evidence of the Egyptian revival taste that spread after Napoleon's campaigns.

Sheraton's influence is undoubted both with his contempo-

raries and afterwards. In England the important firm of Gillow adapted many of his designs, and there are many other examples of variations on his themes. In America the emigrant English cabinet-maker John Seymour owned a copy of the *Drawing Book*, as did William Camp in Baltimore and Joseph Barry in Philadelphia. The Federal style was clearly informed by English pattern books including those of Hepplewhite and Sheraton. Sheraton's writings were also influential in Portugal, Scandinavia and Central Europe, with a German edition being published in Leipzig in 1794.

In England from the 1860s a revival of 18th-century styles began. By the 1880s the taste for Sheraton style was growing apace, with many fashionable businesses offering copies of Sheraton-influenced styles. Even Morris and Co. were producing designs that were informed by Sheraton. Sheraton's *Drawing Book* was re-published in 1895 (c.1910 in Germany) clearly indicating a demand for the sources of this revival of style.

CLIVE D. EDWARDS

Biography

Born in Stockton on Tees, County Durham, 1751, the son of a "mechanic". Trained as a cabinet-maker and draughtsman. Married Margaret Mitchinson, 1779: 2 children. Moved to London c.1790. Active as a teacher, designer and publisher; published series of influential pattern books from 1791. Ordained as a Baptist minister in County Durham, 1800. Returned to London and resumed work as a designer, 1802. Died, penniless and insane; buried in St. James's Piccadilly, London, 27 October 1806.

Publications

The Cabinet-Maker and Upholsterer's Drawing Book, 1791-93; 2nd edition, 1794; 3rd edition, 1802: reprinted with an introduction by Lindsay O.J. Boynton, 1970
The Cabinet Dictionary, 1803; reprinted with an introduction by W. P. Cole and C.F. Montgomery, 1970
The Cabinet-Maker, Upholsterer and General Artist's Encyclopaedia, begun 1805
Designs for Household Furniture by the late Thomas Sheraton, 1812

Shtakenschneider, A.I. 1802–1865

Russian architect and designer

The work of the architect A.I. Shtakenschneider is central in the development of Russian architecture and interior design. He designed the interiors of several important palaces and private homes in a range of historical and revivalist styles, and was highly influential in Russian interior design from the 1830s to the 1860s.

Shtakenschneider was appointed architect to the imperial court in 1848 and carried out the main commissions of the royal family and the nobility. The grand palaces and country estates which he built and lavishly decorated were the last in a long line of sumptuous palaces of the 18th and 19th centuries.

In 1820 Shtakenschneider graduated from the St. Petersburg Academy of Arts, where he had become a skilled graphic artist and architect. This subsequently meant that when he was designing interiors, he was not only able to work out general architectural solutions, but also to make his own designs for furniture and light fittings, as well as studies for stucco moulding, fretwork and friezes.

Shtakenschneider's earliest interiors were designed in the Gothic and Pompeian Revival styles. His reconstruction and decoration of the country estate at Falle near Revelem (now Tallin, Estonia, 1831–33) attracted the attention of Emperor Nicholas I and paved the way for the young artist to receive important commissions in the capital.

One of Shtakenschneider's first projects for the royal family was the decoration of several rooms in the Grand Duke's estate of Znamenok near St. Petersburg (1830s). The use of architectural orders and paintings in the Pompeian style as part of the decor reflected the widespread European passion for the arts of antiquity at the time – an interest which was spurred on by the excavations at Pompeii.

After travelling abroad in 1837 (Italy, France, England and Germany), Shtakenschneider began work on the Mariinsky Palace (1839–44) for the Grand Princess Maria Nikolaevna. This first major work, which heralded a period of creative maturity, turned out to be a great artistic and technical success and brought the architect considerable popularity, leading to further commissions.

The main feature of the palace was the way in which the principal suite of state rooms was arranged, not along the main façade as was usually the case in palaces from the Baroque and Neo-Classical periods, but rather in the heart of the building along the central axis. The combining of different styles in the palace's interiors was characteristic of most of Shtakenschneider's works and was in keeping with the leading trends in Russian art at the time. But he also used a number of new architectural and artistic methods that were to define his own individual style. Among these were the construction of two-tiered colonnades and galleries around the perimeter of the main halls (the Rotunda); an original interpretation of the motifs in ancient Greek painting, which were always strictly

subordinated to the architectonic layout of the walls (the Square Hall); and a refined Rococo decoration in the living quarters (the boudoir). The Mariinsky Palace is one of Shtakenschneider's most important buildings. It was here that his main preferences in terms of interior styles were most clearly defined – namely neo-Greek, Rococo and Renaissance.

Shtakenschneider worked in the neo-Greek manner throughout his life. As a rule, he used architectural orders and paintings in the Pompeian style to decorate the interiors of private homes, and they appear in the two-storey country palace that he built in Sergievka outside St. Petersburg (1839–42). The master sculptors I. Kosolapov and I. Yaishnikov, as well as the artist Drollinger, worked on the decoration of the state rooms. All the furniture for the palace was made by the well-known family firm of Hambs, largely in the Greek style with motifs taken from the Renaissance, working from drawings by Shtakenschneider.

Several of his buildings adhered closely to classical precepts and sought to unify architecture and interior design. Among these were a number of pavilions for the Imperial family – the Tsaritsin (1842–44), Olga (1846–48), Rose or Lakeside pavilions (1845–48) and the Belvedere Palace on the Babylon Heights at Peterhof near St. Petersburg (1852–56).

A small Roman villa served as the model for the Tsaritsin pavilion, but its structure and internal decoration were reworked by Shtakenschneider. The courtyard-atrium with its pool and fountain, covered with a glass roof on account of the northern climate (the roof could be opened in hot weather), was linked to two side rooms via open walkways and arches. The combination of wall paintings, sculptures (both ancient statues and their copies, and works from the 18th and 19th centuries), furniture and lamps in the Pompeian style, and coloured marble floors, including an original Roman mosaic in the dining room, created the impression of the interior in an ancient Roman villa. Even a painted china service and a desk set in the Empress's study imitated Greek ceramics.

The Pompeian decoration of the rooms in the small lakeside pavilion (destroyed during World War II) was subordinated to a precise architectonic articulation of the walls, which were covered in paintings mounted against a terracotta background interspersed with bronze objects.

Shtakenschneider's most important work, built entirely in the Greek Revival style, was the palace, outbuildings and park at Orianda in the Crimea (1841–52; destroyed). Designs based on the Roman villa previously used by Shtakenschneider in the palace at Sergievka and in the Tsaritsin pavilion were now reworked in line with the grand nature of the commission. The centre of the building was a square atrium with a pool and fountain in the middle, surrounded by a colonnade; the main rooms of the palace were grouped around the atrium. Following the example of ancient architecture, the palace had a peristyle: on the east wing there was an inner courtyard with a flower garden and pergolas with trailing ivy entwined along the walls.

Baroque and Rococo were among Shtakenschneider's other favoured styles, and he was one of the first Russian interior designers to revive these artistic trends in the 19th century. He was most consistent in his use of Rococo decoration in the Belosel'sky-Belosersky Palace for which he designed new interiors (1846–48). The building is one of Shtakenschneider's

most significant works. He applied the principle, rare in architectural and artistic practice of the mid-19th century, of the stylistic unity of the interiors within the framework of a single structure (the main state rooms were damaged during World War II and renovated from the 1950s to the 1980s). Shtakenschneider was also a master of Baroque and Rococo decorative methods, interpreting them both in his own unique way. Patterned fabrics, rich stucco moulding, door surrounds with paintings by 18th-century French masters, decorative sculpture by D.I. Jensen, marble reliefs and parquet flooring were all used to decorate the main state rooms at Belosel'sky-Belosersky – the dual flight of stairs, the Small and Large Drawing Rooms and the Dining Room.

As court architect, Shtakenschneider carried out restoration work in several imperial palaces on the outskirts of St. Petersburg. The most significant of these for his subsequent work was his restoration of the interiors in the large palace at Peterhof, originally designed by the master of Russian Baroque, Bartolomeo Rastrelli. Having carefully studied the particular features of Rastrelli's creative style, Shtakenschneider created his own "second Baroque" versions in the east wing of the palace (1846–50). The furniture, chandeliers, wall decorations and paintings were all designed to be in keeping with the objects and decor which remained from the 18th century.

Shtakenschneider's designs for the interiors of the small palace at Petrodvorets outside St. Petersburg, which served as the private dacha for the heir to the Russian throne, marked a continuation of his work in a "second Baroque" style which, like Russian 18th-century Baroque, was closely interwoven with motifs from Rococo interior design (1844–50). The small rooms were exquisitely decorated with paintings, stucco moulding, fretwork and gilding.

Shtakenschneider rarely employed Gothic motifs in his work, but in the 1840s, by which time the Neo-Gothic style had already gone out of fashion in Russia, he resorted to the style to fulfil his clients' demands. With considerable tact, Shtakenschneider added a dining room onto the cottage at Petrodvorets, a small palace belonging to Nicholas I outside St. Petersburg which had been built in the English Gothic style (1829, architect A. Menelaus). He used decorative motifs taken from Western European art of the Middle Ages to decorate and furnish this dining room.

The only building where Shtakenschneider completed both the exterior and the interior design in the Gothic style, was the Gothic House (Villa Renella) near St. Petersburg (1846). The small two-storeyed pavilion with corner turrets had Gothic architectural and decorative elements; its design was an exact replica of a Sicilian villa.

Shtakenschneider's interior designs for the imperial Winter Palace and for the museum rooms in the Little and Old Hermitages, intended to house art collections, revealed the true depth of his talent. However, constrained by the structure of the building with its long suite of rooms, he was unable to solve the considerable problems of space, volume and design and emerged in the main simply as an artist and decorator.

A number of rooms in the Winter Palace – the Rose Drawing Room (1846–47), Green Dining Room (1851), and the "Rococo" Drawing Room (1855–56) – adhered to the Rococo Revival style right down to the minutest detail.

Shtakenschneider used all his favourite artistic devices to decorate these rooms, achieving different effects in each one.

His best work in the Little Hermitage was the Pavilion Hall, built in the north section of the building on the site of several earlier rooms. The room is filled with light and air and gives the impression of both solemnity and elegance. The high two-tiered colonnade splits the room into two sections. One of the walls, which is almost completely taken up with windows, links the room with a hanging garden. The chandeliers with their crystal pendants, the light marble wall-facings, the "fountains of tears" and the elegant staircase unite to make a decor which is acknowledged as Shtakenschneider's masterpiece. Part of the floor is a miniature copy of an ancient Roman mosaic, made from 1847 to 1851 by V. V. Raev, I. S. Shaposhnikov, S. F. Fedorov and E. G. Solntsev from the St. Petersburg Academy of Arts. In his interior designs, Shtakenschneider united ancient and eastern decorative elements, as well as motifs from the Italian Renaissance and classicism, and achieved a spectacular solution to the decorative and artistic problems he faced.

In the Old Hermitage, Shtakenschneider designed a new group of rooms and transformed the old part of the building (1850s). Of the rooms decorated in the spirit of the Rococo and the Italian Renaissance, the Large Hall (1860, now the Leonardo Room) stands out. Shtakenschneider's use of a variety of decorative materials makes this room particularly magnificent.

Shtakenschneider's last great commissions for the Imperial family – the New Mikhailovsky and the Grand Duke Nicholas's (Nikolaevsky) palaces in St. Petersburg – represent a union of Renaissance and Baroque styles. Within the New Mikhailovsky palace (1857–61), every room has its own unique decorative style: Renaissance and Gothic motifs are used to decorate the dining room, while the chapel is decorated in the "Russian style"; the living quarters and main state rooms are decorated with classical, Baroque and Rococo motifs. The artists M. A. Zichi and N. I. Tikhobrazov, among others, painted compositions for the state rooms. Shtakenschneider chose not to limit himself to a strict scheme when designing Grand Duke Nicholas's palace (1853–61). The rooms are arranged both along the building's façades and around several small, light courtyards which are linked by a number of corridors and subsidiary staircases. Of the state interiors, the main staircase and two large halls – the Banqueting Hall and the Ballroom – evoke the greatest interest. Shtakenschneider called upon tried and tested methods, using two-tiered colonnades, porticos and magnificent stucco moulding to decorate the two halls.

Grand Duke Nicholas's palace was Shtakenschneider's last significant work before he died in 1865. Once he had mastered and reinterpreted certain features, Shtakenschneider proceeded to design original interiors in a number of historical styles. His interiors became examples of elegance and good taste and played a significant role in the history of Russian art of the 19th century.

Silks

Introduction

For thousands of years, silk has represented luxury, beauty, and refinement. It has adorned royalty and their households, and has played a primary role in the decoration of the most distinguished public and private interiors. Furnishing and upholstery have been one of the chief uses of silk for centuries, due to its unique versatility. Not only is it soft to the touch, brilliant, fine, and drapes well, it is also strong, resilient, and has insulating properties. Despite considerable developments in artificial silk or Rayon during the 20th century, real silk has not lost its appeal. Indeed, it is as popular today as ever, a fact borne out by the growing demand for the reproduction of old silk designs on hand-operated looms. This section will outline some of the developments and landmarks in the history of silk, from its early origins in the Far East, to its contribution to interior design in the West.

According to legend, a Chinese princess, Xi Ling Shi, first discovered the principles of silk reeling when a silk moth cocoon fell into her tea, enabling her to unravel the fine silk filament. While this story may be apocryphal, the fact that the Chinese first learned the art of sericulture (the cultivation of

silk worms and the extraction of silk from the cocoon), some 5000 years ago, has been proven by historic documents which mention silk cultivation, and archaeological finds of ancient silks in China.

It was certainly the Chinese who developed the hybrid *Bombyx Mori* silk moth, bred for the sole purpose of spinning silk. Although there are many varieties of silk moth found throughout the world, the *Bombyx Mori* produces silk filaments which are smoother, finer, and rounder (and therefore stronger and less prone to tangling) than those produced by other silk moths, making them ideal for spinning and weaving. Today, this remains the most common silk moth used for the cultivation of silk. The moth is blind, cannot fly, and has no digestive system and so is doomed to die three or four days after making its way out of the cocoon, just enough time to mate and lay its 300 to 500 eggs. The eggs hatch out into silk worms, which feed on mulberry leaves before building their cocoons. The worm produces a gum (sericin) which it coats in continuous twin filaments from which it constructs a cocoon around itself. When complete, the filaments produce a continuous strand which, during its uninterrupted life cycle, the moth breaks in order to escape from the cocoon. To ensure a continuous thread is obtained for spinning, the chrysalis must be killed while in the cocoon, and so is stifled with steam. The complete cocoons are then soaked in hot water, and the filament pulled from the outer cocoon ("reeled"), then twisted ("thrown") to form yarn. Once thrown, the silk is immersed in hot soapy water to remove the sericin, before being dyed.

For thousands of years, sericulture remained a closely guarded secret; any leak of information was punishable by death. By the 3rd century BC, Chinese silks had begun to make their way into Asia, over land to the West, and by sea to Japan. Silk and spices were conveyed from East to West along the famous silk roads which initially ran overland from China, along the Northern Steppes, crossing the Altai mountains between China and the Black Sea. By the 1st century AD, another route had opened up, passing through the deserts and valleys of central Asia and on to Syria, doorway to the Mediterranean and link with Western Europe. By that time, China's monopoly of silk production had declined as Asia and India had started to develop sericulture, using the *Bombyx Mori* (smuggled out of China by a Buddhist monk) and their own indigenous silk moths. From India, knowledge of silk cultivation, and the principles of reeling and throwing, spread throughout Asia and the Middle East. Chinese, Indian and Asian silks were imported into Europe as woven cloth.

European trade in silk cloth was dependent on good trade relations with, and ease of passage to, the East. Spain and Italy had such links with the traders of the Eastern Mediterranean (Syria), and relied on imported woven silks brought along the silk roads from the Far East, from Asia, or from the Islamic Middle East.

It was the Moorish invasion of Spain in the 8th century which first brought silk weaving to Europe. The Moors (Muslims from North Africa) occupied a large area of southern Spain including the cities of Cordoba, Granada, Malaga, Murcia, Seville, and Toledo. Initially, the Moors imported raw silk from their Islamic counterparts in the Eastern Mediterranean, but once mulberry orchards were introduced in the Sierra Nevada region, sericulture flourished. Cocoons

Silks: *giardino* velvet used to cover a day bed and sofa, made for the Duke of Leeds, c.1700

were taken to Almeria and Granada where they were reeled and thrown. During the 9th century, “figured” silks were being produced in Spain and exported throughout Europe. By the 10th century, Spanish textiles were being exported throughout the Islamic world, and by the 11th century, Cordoba had become an important economic and cultural Islamic centre, dependent largely on its trade in silks; Spain had become Europe’s main silk producing centre. Government-run workshops called *Tiraz* produced silks for presentation as official gifts, characteristically inscribed with bands of Kufic script. Throughout the occupation, the wealthy and noble inhabitants of Spain were heavily influenced by the Moors’ tastes and use of textiles, and adopted interior decoration incorporating typically Moorish wall hangings and carpets in Arab designs.

Throughout the 10th and 11th centuries, Spanish textiles incorporated bands of calligraphy usually constructed on tapestry inserts, and cloths were often designed as complete units (rather than continuous rolls), suitable for cushion covers and wall hangings. Early Spanish silks incorporating calligraphy were not easily distinguished from those produced in the Islamic world of the East, but gradually the accuracy of the text declined. The letter forms became less angular, more stylised, and were often patterned with flowers and scrolls. From the 12th century onwards (the time of the Crusades), the use of Islamic script as a design element was no longer deemed

appropriate and so was adapted, becoming little more than a stylised geometric decorative pattern, resembling the textiles of Sicily and Egypt.

The early silk designs of Moorish Spain typically displayed Arab characteristics such as detailed geometric patterns infilling a frame, the use of two strongly contrasting colours, and the outlining of designs in black or white. Colours were generally limited to yellow, red, green, blue-green, sky-blue, white and purplish black. Other typically Islamic features included stylised human figures and a variety of animals (peacocks, sphinxes, monsters, white elephants, winged horses, griffins, double-headed eagles, lions, and gazelles). Thirteenth-century designs typically incorporated interlacing lines in horizontal, vertical and diagonal axes, forming grids, stars, and rosettes.

It was during the 13th to 15th centuries that Italy became the largest producer and exporter of silk cloth in the West. The designs produced by Italian weavers were influential throughout Europe and the Mediterranean, and smaller silk weaving areas combined elements of fashionable Italian designs with styles from their own indigenous culture. Spanish silk weavers incorporated elements from their own Moorish tradition in their interpretation of Italian designs, producing strong linear effects, chevrons, striped patterns formed by bands decorated with calligraphy, rosettes, stars, octagons, interlacing geometric patterns, and brocaded velvets with large quantities of gold

and silver thread. Spanish design during the 14th and 15th centuries was very much a hybrid of Eastern and Western influences, containing Italian motifs, but maintaining the intricate geometric structures of the East. Syrian influences can be seen in the continuing predominance of eight-pointed star patterns, lozenges, and roundels containing paired birds or animals, although the prolific use of animal and bird motifs had decreased in popularity. As in Italy, vegetal forms such as pomegranates, acanthus leaves and lotus flowers became increasingly popular design features, and began to be arranged in slightly less linear patterns.

Although there was a succession of wars between the Moorish and Christian kingdoms in Spain, there was also prolific trade. Often, Christian weavers produced silks of strong Moorish influence, and in some centres, Christian and Moorish weavers worked side by side in the same workshop. The merchants of the southern port town Almeria traded with the textile centres of Italy, while Italian merchants were also active in the ports and markets of Spain. In the 14th century, Almeria was an important exporter of raw silk to Florence.

The reconquest of Spain by the Christians was completed in 1492, and during the years that followed, the Inquisition sought to rid Spain of the Islamic "infidels" and indeed anybody accused of heresy. Many Arab weavers fled to North Africa, and were given asylum to work in the workshops there. Although Italy was the leading European producer of silk cloth by the 14th and 15th centuries, Spain was still producing large amounts of silk for the home and export market. The textile industry in Spain was given an extra boost during the 15th century after an influx of Italian weavers who set up velvet weaving workshops. Later, during the 18th century, French weavers and textile designers from Lyon also came to work in Spanish workshops. The diverse influences of the various cultural identities of the weavers working in Spain over the centuries affected the designs of Spanish silks, although, as a result, distinguishing them from those produced in other silk weaving areas can be difficult.

The Moors had also taken possession of Sicily in the late 9th and early 10th centuries, establishing *Tiraz* workshops in Palermo. The silks produced there were similar to those of Spain largely due to the thriving trade which existed between Sicily and Malaga, Almeria, and Valencia. Sicily was then captured by the Norman Roger de Hautevill in 1071. In 1147, his successor, Roger II brought a number of Byzantine weavers and Jewish craftsmen who were skilled at dyeing from Southern Greece, installing them at the Palermo *Tiraz*, where they worked alongside their Muslim counterparts. Silks woven there displayed a fusion of Islamic and Byzantine influences with the Norman's Romanesque style. Sicily flourished under Norman rule and the poem "Le Roman de Guillaume de Palerme" tells of the palace of Palermo with its lavish silk hangings, gold-patterned with human figures, birds and animals. Sicilian textile art was above all concerned with embroidery and *Tiraz* borders of Kufic script. Later, as the French and Spanish struggled over domination of Sicily, many of the skilled workers fled to Italy, to Salerno and Naples in the South, and to Lucca and Venice in the North, bringing new influences and fresh impetus to the designs of those centres while leaving Sicily with few skilled weavers.

As will be seen in the following essay, Italian silks domi-

nated European silk production until the 16th and early 17th centuries, while the French city of Lyon led the field in silk design and production throughout the 17th, 18th and early 19th centuries. It was these Italian and French silks which have had the greatest impact on interior design in the West, although the predominance of textiles for use in European interiors from the 17th century onwards may also be due in part to earlier Islamic influence, with its predilection for wall hangings, cushions, carpets and drapery.

In Western Europe, the main focus of interior decoration had been on paintings and furniture, with few textiles, although tapestry had always played an important role, largely because of its insulating qualities as well as for its decorative use. It was the 17th century which heralded the beginning of the use of textiles as an integrated part of interior design, as they are used today. Following the stimulus of the Italian Renaissance, decorative silks were increasingly used to bring a hitherto unknown degree of comfort to the interiors of the wealthy. Textiles were used as wall hangings, portières (drapes over doors), furniture upholstery, bed hangings (known as bed "furniture"), window curtains and blinds, floor coverings, and as drapes on furniture. Silk was a popular choice for furnishing fabric because of its combined beauty and practicality. It has a natural lustre and is highly absorbent, soaking up dye stuffs easily, allowing for a wealth of designs, shades and colour effects. It is also rot-proof and very strong (1mm silk yarn will support a weight of 45 kilos), as well as being remarkably fine (a cocoon weighing 3 grams gives 1000 metres of yarn). These attributes made silk an ideal choice for use in interiors, where the more costly textiles would be expected to retain their glory for generations.

The basic principle of weaving involves the interlacing of threads called warp (running vertically) and weft (running horizontally). Decorative effects can be produced by using different weave patterns, by using different types of yarn and different combinations of yarn thickness, and by using different colours (either incorporated within the weave structure, creating stripes and checks, or applied to the surface of the fabric during the weaving process).

The main silk fabrics used in interiors during the 17th century were velvet, taffeta, satin, and ribbed silks, as well as figured fabrics such as damasks, and brocades. Velvet was a popular, although expensive, choice for furnishing textiles because of its durable structure, its appeal to the senses (velvet produces rich deep colours and is pleasing to the touch), its insulating quality, and the "padded" comfort it provides. The most sumptuous of textiles used in interiors, velvet involved the most extravagant use of the costly silk yarns, making it the most expensive type of cloth. Only the very wealthy could afford the complex patterned velvets, either those incorporating different colours, areas of cut and uncut pile, *ciselé* patterns produced by different heights of pile, and *devoré* decoration in which areas of the pile are burnt out by a chemical process, leaving the plain ground exposed. The most magnificent velvets of all were those with decorative pattern produced by brocaded areas of gold or silver thread. Throughout the 17th century, velvet was used only on the most important items of furniture. Less important furniture was upholstered using damask, the second most expensive type of fabric, or cheaper brocatelles.

During the 17th century, it became fashionable among the wealthy to hang walls with lengths of fabric. Sometimes a room would have two different sets of hangings for use at different times of the year, or just one set which would be taken down and stored when the family was not in residence. Hangings required large amounts of fabric and so were expensive, and worth preserving. They had to be easy to take down and so were either attached to detachable battens, or fixed to the wall by means of hook and eye fastenings. Tapestries were the most valuable of wallhangings, as they were hand-woven, involving great skill on the part of the weaver, and formed a complete piece, often produced to commission. Other popular cloths used for wallhangings in the most prestigious settings included crimson silk damask and plain silk velvet. Less formal rooms were often decorated with chintz (printed and glazed cotton), which, although attractive, was cheaper to produce.

In response to the demand for wallhangings which required large pattern repeats, damask weavers produced large figured patterns incorporating stylised motifs including crowns, lotus leaves, pomegranates, and artichokes, either framed or intertwined with meandering stems and stylised leaf forms. Chairs were upholstered in the same fabric as the walls; the Queen's Closet at Ham House is a good example of the en-suite combination of brocaded satin as wall-hangings and upholstered armchairs. Portières were also en-suite. These were drapes hung over doors, initially required for the purpose of insulation, but later maintained purely as decoration. Window curtains had also begun to be exploited as a decorative feature. Previously, the role of curtains had been purely functional; they were used in conjunction with shutters to protect against the cold at night, and were constructed from wool for maximum insulation. With advances in architecture and the production of glass, the need for such insulation lessened, and heavy wool curtains were replaced with lighter fabrics (usually silk) arranged in symmetrical formation around windows. Like portières, curtains were usually en-suite with the wall hangings, bringing a coordinated and controlled atmosphere to interiors.

The other main use of silks in interiors throughout the 16th, 17th, and 18th centuries was for bed hangings. These usually comprised two to four separate curtains, a canopy (or "tester"), valances around the top, fabric over the base, a fabric-covered headboard, bed covers, and sometimes a matching floor covering. Silk damasks, satins and velvets were the most popular choice of fabric, sometimes embellished with embroidery, brocade, or passementerie (braid trimmings, tassels and bobbles).

By the 18th century, textiles were the principal form of decoration in interiors. Towards the latter half of the century, velvets were no longer favoured for upholstery, except for the polychrome velvets such as "giardino velvets" (*velluti a giardino*; see Italian Silks) which continued to be popular as upholstery fabric. Velvet was used extensively in borders and trimmings, however, which became a feature characteristic of 18th-century upholstery, and was generally retained for use in carriages, for both insulation and comfort. Towards the end of the century, designs became more restrained, smaller, with stylised motifs and a simpler, less flamboyant feel.

Developments in loom technology during the 19th century led to more efficient large-scale production methods for all

kinds of woven cloth, but particularly velvet, which could now be produced by weaving two pieces of cloth face to face with one single pile warp shared between them which was then cut mid-way between the two cloths, producing the pile. Velvet became quicker and easier to produce, reducing the cost and increasing availability. The Victorian interior for upper and middle-class families became characterised by an excessive use of draperies in plain and figured velvets, creating a heavy, muffled atmosphere. Very little furniture was left uncovered by fabric of one sort or another; tables were often bedecked with two separate cloths, one of which would usually be a heavy velvet decorated with tassels. Every harsh angle was covered, padded in some way, emblematic of the 19th-century ethos of the home as haven, a cosy place of repose, comfortable and "cushioned" from the harshness of the outside world. By the late 19th century, a general dissatisfaction with the present and a glorifying of the past was represented in interiors by a renewed interest and revival of Renaissance and 18th-century silk designs, preferably (for those that could afford it) produced on a hand-operated loom.

Silk has continued to be a symbol of luxury, but with modern chemical applications, synthetic silk can effectively reproduce the feel and look of silk satins and velvet, although there is still a market for woven designs, both traditional and modern, produced on hand- rather than machine-operated looms. The call for exact reproductions of 17th and 18th century silks where the originals have decayed, faded or become damaged with age, has increased over the last decade, as historical accuracy has become a preoccupation within historic houses and public buildings, where the demands of a paying public require the replacing of worn out fabrics on grand pieces of furniture such as couches, sofas, and most of all, the great beds.

Italian Silks

Sericulture, the cultivation of silk worms and the extraction of silk from their cocoons, is thought to have been introduced into Italy during the 10th century. Until then, Italy had played an important role in importing silk fabrics into western Europe from the Byzantine and Islamic empires of the East, but did not have the skills in, or knowledge of, the processes involved in sericulture to enable the production of raw silk, and, therefore, the making up of silk into fabric. However, during the 10th and 11th centuries, sericulture was established in Southern Italy and Sicily, probably brought from the East by Jewish, Greek, and Arab immigrants. It is likely that the Jewish immigrants, who specialised in the dyeing and weaving of silk and who controlled the largest share of the market for silk goods in the southern cities of Italy, were responsible for the introduction of silk weaving into the North: into Tuscany, Venice and Genoa.

The Tuscan town of Lucca, the largest Jewish centre north of Rome (Scott, 1993), was to become by the 13th century the most important silk weaving centre in Italy. One of the reasons behind the success of the Lucchese silk industry lies in the town's geographical location. Lucca had been an important trade centre from Roman times, with roads leading from Rome to Pisa and Florence, as well as being within reach of the inland

Silks: Luccese silk with design of winged animals, 14th century

port at Pisa, with its long established trade routes to the east and the west. Not only had many of the silk producers and weavers migrated to Lucca from the South, bringing with them their knowledge and skills, but also the silk merchants were able to capitalise on the already existing trade routes which enabled the Luccese silks to be transported and sold throughout Italy and into the rest of Europe.

Towards the end of the 14th century, Lucca was producing a great variety of silk textiles for use in both clothing and interior decoration. The most expensive and lavish fabrics such as those using large quantities of precious metal thread were produced for ecclesiastical use or for the adornment of kings and palaces, while less extravagant velvets, brocatelles, damasks, lampas, and plain and brocaded silks were used in home furnishings. Lampas silk, created by means of two warps

and a minimum of two wefts, which produce a figured fabric with a plain ground which unlike damask, is not reversible, was initially woven in Lucca during the 13th century in one or two colours, sometimes with gold or silver threads.

By the 14th century, Lucca was producing Lampas silks of three colours. A similar development took place in the production of figured velvet which by the late 1300s was also being woven in as many as four different colours with up to three different heights of pile. Velvet was a popular choice for furnishing textiles largely because of its durability, and its soft texture and appearance, just as damask was suited, with its contrasting textures and play of light on fabric, to wall and bed coverings. Brocatelles were woven specifically for use as wall hangings, usually incorporating linen wefts to hold the heavy weight of the fabric.

Early Luccese silk cloths were patterned with designs similar to those of the textiles of Persia and Byzantium, often depicting eastern animals and motifs enclosed in "frames", but by the 12th century, these had become stylised, the frames were no longer a feature and native birds and winged animals were introduced into the design. 13th-century features also included references to heraldry and Romanesque art. Throughout this period, silk cloth from the East was still being imported into Europe, largely via Italian ports. A brief period of peace with the Mongolian empire during the 14th century led to the import of Chinese silks, brought along the overland silk road from Cathay, which, while not directly copied by the Italian silk weavers, influenced the feel of the Luccese silks (Lisa Monnas in Harris, ed. 1993). Motifs such as dragons and pomegranates were incorporated with western ones, and the fluid lines and asymmetrical patterns of these new imported silks were reflected in a move away from the static and symmetrical in Italian design. Motifs began to be arranged, not in rows, but diagonally. Towards the end of the 14th century, human figures also began to appear in silk designs, along with depictions of hunting scenes, courtly romance, religious scenes, ships, tents, and castles (Scott, 1993).

By the end of the 14th century, Lucca could no longer boast supremacy over other silk weaving centres in Italy. This was largely due to the tensions and jealousies which prevailed between the different towns and cities of the country. Throughout the medieval period, Italy was composed of autonomous city states whose rulers would compete with each other for political power. Such power was dependent upon economic strength, which during the 13th, 14th and 15th centuries was linked with the strength of local industries, particularly silk weaving, and the success of the merchants who diffused local goods across Italy and Europe. Rivalry between weaving centres could take the form of imitation of designs and weaving techniques, and towns took great measures to prevent the poaching of their skilled textile workers. In Lucca, for example, the Silk Weavers Guild, the *Arte della Seta*, threatened its members with death if any of them became engaged in the production of silk outside the city's boundaries (Scott, 1993). At times the rivalry between states would lead to hostilities and war, which could also affect local silk manufacture. When the Pisans, under Ugaccione della Fagiola, sacked Lucca in 1315, many of the town's skilled craftsmen were scattered across Italy, and were forced to set up silk weaving businesses in some of the most powerful city

states such as Florence and Venice. Consequently, the Lucchese silk industry fell into decline while Venice, Genoa and Florence became the key centres of silk production.

Unlike Lucca, the silk weavers of Venice tended to imitate Eastern designs rather than assimilate them and combine them with native motifs. This was due to the nature of demand. Venice was a major port and centre of international trade between East and West, into which were brought precious silks, spices, gems, and other goods from the Eastern Mediterranean. The taste of the city's merchant nobility, the main consumers of luxury goods such as gold and silks, was distinctly oriental, due to the fact that Venice had closer ties with its trade counterparts in the East than with the other cities of Italy and the West. As a consequence, it is sometimes very difficult to differentiate between Venetian designs and those of Persian textiles. Because of its commercial activity Venice was a wealthy city, but its successful merchants had little on which to spend their amassed fortunes other than the display of luxury in palaces, clothes, furnishings and works of art; both imported and locally produced silk played a significant part in this.

Silk weaving had begun in Venice as early as the 10th century, but it was the migration of exiled Lucchese silk workers to the city which helped to raise the standard of Venetian silks to a position of eminence. By the mid-15th century, silk weaving was playing a major role in the city's commercial activities, a fact that was recognized by the city authorities who formed an inspectorate whose job it was to monitor the workmanship of silk cloth. In so doing, the high quality of the Venetian silk industry could be assured, along with the wealth that these silks would generate. Cloths of exceptional quality were generally reserved for the home market while those of lower cost and inferior quality were exported both to the East and the rest of Italy.

However, it was perhaps the Genoese silk velvets which made the most significant and lasting contribution to interior design. The 14th century techniques of polychrome velvet weaving, developed in Lucca during the time of its leadership of the silk weaving industry, were continued in Genoa, as was the use of *alto e basso*, or pile on pile velvet. The combination of these with the technique of cut voided velvet created colourful three-dimensional designs in bas-relief. Known as *Velours de Gêne* ("Genoa Velvets"), these featured, typically, patterns based on large S-curves over a voided ground. Despite its name, this velvet was produced in other silk centres in Italy and beyond, although the most precious were, indeed, those of Genoa. The same can be said of the famous *velluti a giardino*, which were used extensively in the homes of the wealthy for decorating upholstery and for wallhangings up until the 18th century. As the name would suggest, the main features of these "garden velvets" are ornate floral motifs surrounded by foliage, depicted in multi-coloured cut and uncut velvet on a voided white or ivory ground, sometimes with a silver *lamella* (thin pliable sheet) weft. Giardino silks, easily recognizable despite modifications in style caused by changes in fashion, remained the most popular of the furnishing fabrics, and although associated primarily with Genoa, were produced in all the major silk weaving centres throughout the duration of their popularity. However, no other silk centre was able to improve on the Genoese product.

By the 15th century, the phenomenon that was later to be termed the Renaissance was well under way, with artists seeking to depict the natural world with greater realism than their forefathers had managed to do. These developments in the world of art were echoed in the textile designs of the period as greater realism was achieved through the use of chiaroscuro (light and shade) in velvet designs, and a faithfulness to nature was sought in the depiction of animals and plants (particularly flowers) in both lampas silks and velvet. This was the heyday of the pomegranate motif in textiles, along with its developments in the form of pinecones, thistles, and even pineapples from the New World. Usually, these motifs were placed within an ogee frame created by undulating stems of foliage moving upwards from a central point to create a symmetrical unit, often depicted as acanthus leaves.

Technical developments throughout the 15th century also influenced the designs of the period, mainly in the use of metallic gold thread. During the 1420s gold weft loops were introduced into the weaving process, supplementing the brocaded patterns on *feronnerie* velvets (so called because of their supposed resemblance to wrought-iron work) and damasks. These were used to decorative effect in two forms: *riccio sopra riccio* (loop over loop) with an appearance like uncut velvet, woven in two heights, and *alluccio* with individual loops appearing in areas of the pile, creating a glistening effect in the fabric. Gold brocade also became more extensively used as advances in the manufacturing and weaving process allowed yellow silk weft threads to be added to the gold thread. Large expanses of gold could now be incorporated into fabric designs without the great expense that such lavish use of precious metals would have incurred before. Typically, a large surface area of brocaded gold became the main feature of these high cost fabrics, with small parts of the ground (lampas silk or velvet pile) showing through to form the outlines of complex patterns.

Of course, *riccio sopra riccio* was the most extravagant and costly use of precious gold threads. The technique was therefore reserved for the making of wallhangings and ecclesiastical and royal garments, the fabric woven to shape on commission to avoid wastage. While weaving to shape was practised in all the major silk weaving centres, this was a particular speciality of the city state of Florence.

The weavers of Florence, many of whom had originated from Lucca, were renowned for their fine velvets and high quality silks, particularly those bearing gold and silver. 15th-century Florence was one of the wealthiest banking and mercantile centres in Italy, boasting a large number of craftsmen catering for the luxury market, such as goldsmiths and high quality silk weavers. The chronicler of Florence, Benedetto Dei, wrote in 1472 that "the number of workshops belonging to the *Arte della Seta* was 84, wherein the industry of weaving cloth of gold, silver brocade and silk tissue of every colour and texture was carried on" (Bunt, 1962). He estimated that over 16,000 people were involved in the making of silk. Neither was there a shortage of designers or inspiration for design. Florence was famous for the outstanding achievements of many of its citizens in the fine and applied arts, and probably counted many artists among its textile designers such as the artist Vittore Pisano, who is known to have created designs for silk weaving.

The impact of Florentine silks was felt far and wide, with exports throughout Italy and beyond to France, Spain, Morocco, and to the Levant (what is now Lebanon, Syria, and Israel). The Venetian–Ottoman war of 1463–79 also gave the Florentine merchants the opportunity to extend trade in silks with the Ottoman empire, which had previously been the monopoly of the Venetian traders. In 1516, Henry VIII of England appointed Florentine merchants to purvey cloths of gold and silver to his court, and his household accounts show that Florentine silks of gold and silver were purchased for the decoration of the tents of the Field of the Cloth of Gold, erected for the staging of important negotiations with François I of France (1520). The Florentine silk industry, then, reached its heyday during the 15th and 16th centuries, catering for the elite, the international market in luxurious, high quality goods.

The High Renaissance of the 16th century, with its revival of interest in all things classical and the study of ancient Greek and Roman ruins and artefacts, was reflected in designs for furnishing fabrics of the period so that vases and urns, containing clusters of flowers or leaves, began to appear as decorative motifs. Meanwhile, the ogee lattice continued to feature in designs, but the foliage became increasingly elaborate. Building on the developments in the technique of brocaded effects of the 15th century, a greater diversity of design and types of fabric and pattern appeared, while for the first time, a distinction began to emerge between the designs used for dress and those used for upholstery and wall decoration. Furnishing fabric designs usually consisted of larger, bolder patterns than those of clothing, with arrays of stylised flowers and foliage, arranged in asymmetrical patterns, with small repeats.

Italy was, during the 16th and early years of the 17th century, still leading the field in textile design, with French producers imitating the Italian style, particularly in the area of furnishing fabrics where styles were created *à l'italien* typically using motifs constructed from branches of foliage arranged in symmetrical patterns. Italian producers supplied designs to French weavers, and invited French apprentice weavers to train with them.

By the end of the 17th century, however, Italy's prominence on the international market for silks was in decline. As demand fell, so production decreased. In Lucca, for example, the number of looms recorded in the city fell from approximately 2000 to 500 during the century, while in Venice, the output of finished silk fabrics fell from 6000 in 1662 to 3–4000 by the end of the 1690s (Ciriaco, 1981). French silk weavers had vied with their Italian counterparts for a share in the luxury market for many years, but had never been able to equal the complex techniques required to create the intricate patterns of figured silks which the Italian weavers were able to achieve, drawing from centuries of experience. This situation was reversed by the end of the 17th century as the French silk industry began to compete with Italy for prominence in the production of luxury silk goods.

The reason behind the success of the French silk industry over that of Italy lay in the emphasis placed on technical innovation and design, reinforced by state support of French production and the encouragement of industrial enterprise among producers. The introduction of Claude Dongon's loom *à la grande tire* at the beginning of the century enabled the imitation of the most complex Italian figured silks, particularly

pile on pile velvets, and the development of this into new designs for high quality silks which were not dependent on the imitation of Italian styles. State support in the form of market intervention, such as the 1669 decree which impeded the importation of foreign silk goods, also weakened the Italian influence on French silks. By the 18th century, large amounts of French silk of both medium and high quality were imported into Italy. Italian silk weavers were now forced to follow the fashions set by their French counterparts.

State support of the French silk industry was also provided through the commissioning of French silks for the household of Louis XIV. Furthermore, the extravagance of life at the French court under Louis XIV was conducive to an increased demand for frequent changes in fashion. Fashion provided the demand for new silks and stimulated the regular introduction of fresh patterns and fabrics. In France, improvements in technology and business practice meant that producers could adapt to changes in demand, whereas in Italy, because of their reliance on traditional methods of production, weavers were unable to respond as efficiently.

By the 18th century, French supremacy in the production of silk had extended to sumptuous velvets and brocades, suitable for royal furnishings; a market which had traditionally been the monopoly of the Italian producers. And yet Italy was still able to maintain a competitive position within the European market for high quality silk products. The expensive *velluti a giardino* produced in Genoa continued to be a popular choice for furnishings until the middle of the 18th century. The availability of raw silk combined with cheap labour ensured that quality could be kept at a premium while cost could be kept relatively low. Italy also continued to produce silks of medium quality.

Changes in fashionable taste during the late 18th century meant that the plush, heavy velvets traditionally used for furnishing textiles were replaced by lighter satins and lampas silks, with polychrome velvets being relegated to use in borders and hems. Italy continued to produce a range of silk fabrics for furnishings, often combined with cotton, linen, or wool, for greater durability, in both figured and plain designs, often containing elements or motifs of 14th and 15th century patterns.

The later years of the 19th century were characterised by a revival of Medieval and Renaissance textile designs, and a return to the use of heavy drapery, particularly velvets, in interiors. Italy's silk heritage was an ideal source of inspiration and design, and textile designers such as William Morris made studies of surviving examples of fabrics woven by 14th and 15th century craftsmen, incorporating elements of these in their own designs. Within Italy, a number of silk manufacturers began recreating historic designs, often employing traditional hand-weaving techniques alongside 19th-century mechanical looms.

Hand weaving of Renaissance designs has continued throughout the 20th century, catering for the luxury market in furnishing silks, along with the resurrection of designs from other periods in history, including the textile designs of Byzantium, Baroque and Rococo styles, and Art Deco fabrics. Today, Italy is the largest importer of raw silk in Europe, although most industrial silk production is centred in Milan and Como in the north. Yet specialist silk producers in Italy

continue to draw on their rich artistic and design heritage in producing fabrics, both traditional and innovative, for sale on the luxury market. It is to this end that La Fondazione Arte della Seta was established, achieving government recognition as an institute of education in 1971, which promotes education and research in the art of hand-woven silk, past and present, as well as reproducing historic silk velvets, lampas and brocaded silks, and silk damasks, for use in interiors.

JENNY SILVERTHORNE WRIGHT

French Silks

The silk industry in France owes its existence largely to state patronage. Its beginnings coincided with the arrival of the papacy in Avignon in the 14th century, and in the 15th century, for the first time, two French monarchs formally established silk weaving in Tours (1470), Nîmes (1498) and Lyon (1536). A few silks were also woven in Paris in the 17th and 18th centuries (Thornton, 1965), at the time that French silks began to replace Italian silks in the inventories of the Royal Household (the *Gardemeuble*). As times changed, so too did the industry, but only the Lyon branch has survived up until the present day. It has, nonetheless, undergone many adaptations both in terms of its products and the processes by which they are manufactured. The main changes relate to the use of new techniques, new technology and new fibres.

Lyonnais survival may in part be attributed to the extent and range of products (from the most flamboyant and expensive dress and furnishing silks to the humbler silk accessories and silk mixes), to their attention to design and to the continued support of the French government which takes care of the refurbishment of the former royal palaces and concerns itself with promoting French products. The International Silk Association has had its seat in Lyon since 1947, and *haute couture* and *Première Vision*, the most innovative of textile fairs, have acted as showplaces for Lyonnais fashion silks since the 1860s and 1940s respectively. The relationship between fashion and furnishings has been extremely close.

Because silks are a luxury, especially for large furnishing projects, the industry has been marked by many fluctuations. For example, periods of mourning, war or the failure of the silk crop have dramatically affected the amount of work available and the lives of the workforce. In times of distress, under the Ancien Régime and under the various Empires, the court came to the rescue of the weavers, commissioning large quantities of top quality goods, either for furnishing projects or for court dress. For example, in 1730, as a response to the petitions of the weavers, Louis XV ordered seven sets of furnishings of the most expensive type with heavy gold and silver ornamentation – three different brocaded designs on a red ground, one on blue, one green and one on yellow and a velvet with a gold ground. They were “for the service of the King” rather than for a defined purpose or room, and were hung at different intervals over the following fifty years in Versailles, at Marly and Fontainebleau. The commission kept certain weavers in work for about six years (Coural, 1988).

State support was important not only for keeping the weavers in work for several years, but also for stimulating demand from other sources, notably the French aristocracy, foreign courts (for example, Spain, Russia, Sweden) and the

increasingly wealthy middle classes. Assessment of the importance of different clients or markets in keeping the industry afloat is impossible at present, as many requests for furnishings arrived through intermediaries such as the *marchands-merciers* based in Paris, *commissionaires* who travelled widely in the provinces and abroad, agents who based themselves at specific foreign courts, and, later, interior decorators. Documentary evidence of purchases is therefore scattered. From production records, however, it is evident that a range of silks was manufactured for furnishings, and these silks catered for different markets. At the top end of the spectrum were the extremely expensive gold and silver brocades which feature in the royal order of 1730 and in the Napoleonic commissions. More modest, but nonetheless striking polychrome brocaded silks were popular at this level in the second half of the 18th and during the 19th century. On the other hand, damasks have been a staple throughout the history of the industry – affordable by the middling ranks. If they were not bought new, they were purchased secondhand. Various advertisements in the press of the period testify to the resale of, or search for, large quantities of damask for such purposes (Miller, 1988). Fabrics with gold and silver threads were also attractive secondhand, as they could be recycled for their metallic content – many of the court's possessions met this fate in the early years of the French Revolution.

Materials and methods of manufacture changed over the period. Even in the 18th century, when the traditions and working practice of the silk weaving guild supposedly impeded innovation, new ways of patterning and new yarns contributed new effects: Genoa velvet was promoted in the 1730s, watering (*moirage*) became popular in the 1750s, chiné in the 1760s and embroidery in the 1770s. Chenille yarns sometimes replaced silver and gold halfway through the 18th century, giving a soft yet luxurious appearance at a lower price. In the 19th century, the main innovations were the Jacquard loom (operational from 1814) and the power looms (operational from the 1870s). The former enabled patterns to be woven mechanically rather than by hand, thus reducing the time required for production, while the latter speeded up the process and had almost ousted handloom production by the mid-1920s. As a result of the space and energy sources required for this kind of loom, much weaving moved to outside the city of Lyon. By the mid-1920s, silk screen printing and the inclusion of man-made yarns again increased the range and, in some cases, reduced the cost of silk fabrics. In 1938 rayon accounted for about 72 per cent of fibre consumption in Lyon and by 1970, although proportionately speaking the consumption of rayon had dropped, combined with synthetic fibres, it accounted for 75.5 per cent. Silk had dropped from 50 per cent in 1890 to a negligible 1.2 per cent in 1970 (Pommier, 1980). Thus, although fame was built on the back of silk, the industry changed radically between the late 19th and mid-20th century. It should be noted, however, that the old skills of drawloom weaving have been kept alive, and survive today in the historic silk firms Prelle et Cie. and Tassinari et Chatel, as well as the newer co-operative, Cooptiss.

Just as silks relied on technical innovation, so too did they depend on fashionable changes in taste. Thus they followed the trends visible in all the other decorative arts and set the tone for other textiles until the late 18th century: heavy, stylised

Baroque motifs in the late 17th and early 18th century, light Rococo fantasies mid-century and Neo-Classical features from the 1760s onwards – light and decorative initially, but much heavier and more geometric under the Napoleonic Empire. In the 19th century, under the Restoration and the Second and Third Empires a certain conservatism was evident in the choice of recycled styles from previous periods. Even the only invention of the period (“free Renaissance”) relied on combining motifs from different 18th-century Rococo arts to produce a recognisable 19th-century aesthetic (Rococo meanders of flowers combined with plasterwork cartouches). In the 20th century, Art Nouveau had a moderate impact, and the Art Deco boldness of Dubost, Dufy and Seguy stands out. These new designs ran alongside rewavings and adaptations of old patterns.

Design as an occupation evolved over this period and designers became an identifiable and highly regarded group within the industry by the mid-18th century. Ultimate recognition came in the form of national legislation which protected their work from copyists in 1787, when furnishing designs were protected for fifteen years.

Having relied on Paris for their artistic training, and on Parisian artists for sketches for the most prestigious royal commissions at the end of the 17th and at the beginning of the 18th century, by 1756 the Lyonnais were confident enough in their own expertise to set up their first public school of drawing (*école gratuite de dessin*). They took advice from the Parisian establishment (Jean-Baptiste Oudry at the Gobelins and Jean Jacques Bachelier at Sèvres), and still maintained that regular visits to the capital were an essential part of keeping alive designers’ creativity and awareness of trends. This relationship with Paris and Parisian studios has never really died.

From a technical point of view, Lyonnais designers were better equipped to design for the loom because they could gain direct experience from working on it in their own city. For brocaded designs this was essential. Despite social upheaval, the school continued into the 20th century, and it is no coincidence that the most exciting silks emerged at times when both artistic and technical skills were taught. The 18th and the early 20th centuries epitomise this approach. Philippe de Lasalle (1723–1804), who designed very elaborate pastoral and figurative furnishing silks for many European royal courts and made improvements in the drawloom, received ennoblement for his services to the industry. He had benefited from and advocated learning both drawing and weaving skills. An innovative successor at the beginning of the 20th century, Michel Dubost (1879–1952) felt strongly about these two aspects of training. His short spell of teaching at the Ecole des Beaux-Arts (1917–22) and his own subsequent involvement with the manufacturer, Ducharne, produced many successful modern designs. In between these two luminaries, in the 19th century, when the school in Lyon was laying too much emphasis on fine art and painting, Lyonnais design was in the doldrums and manufacturers had to seek help from the designers of the flourishing cotton-printing centre of Mulhouse in Alsace.

French silks have been used in grand domestic settings and official buildings, by middling and aristocratic customers, at home (in France) and abroad. In general terms the consumer base has expanded over the centuries, with the middling ranks becoming more important from the accession of Louis-Philippe

(1830) onwards. Even so, domestic consumption alone did not sustain the industry, and exports to most of Europe, to North and South America and to the Levant have been important since the 18th century. While Paris was the main source of design ideas and main marketplace for silks, the Lyonnais also actively pursued custom in a number of European courts, even before Napoleon ruled in 1814 that every occupied court should acquire and display French silks. With the advent of railways and steamships, furnishings were needed for new purposes, as the railway companies were anxious to provide interiors as sumptuous as those in city and country dwellings – if not more so.

On the whole, the use of silks in interiors denoted a certain formality, and was the prerogative of the wealthy. The quantities of fabric required for the fashionable sets of furnishings ensured this. These sets were composed of wallhangings with matching upholstered furniture and curtains. In palaces and large mansions, apartments served a number of purposes, and silks were therefore appropriate for any room. In middling households, silks were on the whole restricted to the most important and public rooms and sets of furnishings were rare until the mid-18th century.

The example of Louis XIV was influential, but in reality affected only a few. His State Bedchamber (1679) at Versailles, where he received the most important members of his household and sometimes visiting dignitaries, was resplendent in red, gold and silver. The walls were hung in brocaded silk which matched the upholstered seats round the edges of the room, the curtains over doorways and around the bed, the bed tester and its headboard and counterpane. The lining of the bed curtains was plain red satin with gold and silver embroidery (Schoeser, 1991). Such splendour contrasted with the more modest adoption of silk hangings and furnishings in middling Parisian interiors in which woollen and linen hangings were far more common. By the 1750s, however, inventories show evidence of more luxurious fabrics in better rooms. For example, in 1751 a chaplain to the king’s brother left a room in which the walls and oak armchairs were covered in striped *moiré*, a simple silk fabric with a textured effect (Pardailhé-Galabrun, Annik, *The Birth of Intimacy: Privacy and Domestic Life in Early Modern Paris*, 1991).

In many ways, Napoleon adopted Ancien Régime practice, although he used the most sumptuous fabrics only for his and his wife’s rooms. The motifs were Neo-Classical, and a number of different patterns might be used in the same room, but the notion of suites of furnishings remained. Most sumptuous, apart from the imperial interiors, were public commissions such as the one for the main reception room of the town hall in Lyon. Ordered in 1827 from the well-known firm of Grand frères, it comprised 657 metres of bright red silk brocaded in four different gold threads. They were for wallhangings, borders, draperies and also the *fauteuils* in the chamber. Two years later they were complete. The coat of arms of the city featured in the centre – a sign of the municipal significance of such an order.

Grand frères also benefited from the new increasingly wealthy middle classes, numbering the bankers Schinkler, Lafitte and Rothschild among their clients in the 1820s. These wealthy men and their American counterparts at the end of the century, such as Vanderbilt, subscribed to an elaborate and

ostentatious use of silks in bedrooms as well as public apartments. Often damask was a favourite for wallhangings as well as ornately draped curtaining, as it was at the Château de Compiègne, one of the homes of Napoleon III and his Empress Eugénie. But it was Napoleon III's imperial train which epitomised the excesses to which public interiors could go. Decorated in 1856 by Viollet-le-Duc, the bedroom had a bright blue velvet ceiling and red velvet walls and door curtains. The latter were lined in white *gros de Naples*. In contrast, but nonetheless sumptuous, was the *wagon d'honneur*, with bright green silk damask wallcoverings and upholstery, a gilded and painted ceiling (Schoeser, 1991). No doubt such richness was possible because the area of wall space was somewhat smaller than in actual houses.

Although silks continued to be used in the 20th century, modern interiors tend to be plainer. The use of fabrics on the walls seems to be a particularly French taste, not completely outmoded by the arrival of wallpaper in the 19th century.

LESLEY ELLIS MILLER

Glossary of Textile Terms

Brocade Surface decoration applied to cloth during the weaving process. A decorative pattern of an unlimited number of colours is applied to the fabric during weaving, although it does not form part of the weave structure itself, producing a raised design on the fabric, and thus resembles embroidery. The ground weave can be of any kind.

Brocatelle A less extravagant use of silk yarn. It can be either damask or velvet, but the warps are linen and the wefts silk. It was particularly used for wall hangings as the linen helps to support the weight of the fabric. Produced using a silk warp face with unseen linen wefts.

Chiné Fabrics with a "clouded" or hazy pattern, popular in the 18th century. The effect is created by the design which is printed onto the warp threads before weaving.

Damask One of the oldest decorative weaves, originating in China, although it takes its name from Damascus in Syria. A pattern is created in the cloth using different types of weave in combination, either using the same or two different colours. The process involves the use of more than one set of warp threads and / or weft threads, and so is known as a compound weave. The pattern produced is flat, and, usually, reversible.

Embroidery Decorative needlework applied to already woven fabrics.

Figured Fabrics (usually silk) in which a pattern is created within the weave rather than with brocade or embroidery.

Ribbed or Corded Fabrics produced by using a higher number of fine warp threads to fewer, thicker, wefts. The thicker wefts are covered by the warps, and the warps are double-twisted, creating ribs. These can be either plain, or *moiré* (pressed through rollers to produce a watered effect).

Satin Weave that produces a highly lustrous, smooth fabric, ideal for draperies. The yarn is woven such that a large number of "floating" warps are left exposed on the front of the fabric, held in place by a smaller quantity of supporting wefts.

Shot Silk Plain weave silk which has different coloured warp and weft threads producing a changing effect depending on how the light falls on the material.

Taffeta The most straightforward of woven silks, employing the basic plain weave principle of one under, one over. It has a characteristically dry rustling feel, and is easily recognizable as silk because of its

shiny nature. A thin form of taffeta called "sarcenet" was popular during the 17th century for linings and sun curtains.

Tapestry Ancient form of decorative weaving, with a weft-faced plain weave made up of discontinuous weft threads, allowing the weaver to create pictures or patterns. These were usually constructed from worsted – a finely combed and highly twisted wool, but often incorporated silk yarns.

Velvet Originally produced on the loom by the use of an additional warp thread woven over rods, which, when removed, left loops on the fabric known as pile, which could either be cut to produce the characteristic furry texture of velvet, or left as loops.

Silver Studio

British wallpaper, textile and metalwork design studio, 1880–1963

The Silver Studio of decorative design was founded in 1880 by Arthur Silver (1852–96) at 84 Brook Green, Hammersmith, West London with the aim of “bringing together a body of men to establish a studio which would be capable of supplying designs for the whole field of fabrics and other materials used in the decoration of the home”. Arthur was the son of a successful Reading cabinet-maker and upholsterer and had attended the newly-established Reading School of Art. He was apprenticed to the well-known and eclectic London designer H.W. Batley in 1871. Batley taught him the techniques of designing for a wide range of media including carpets, chintzes and wallpapers and introduced him to Japanese art and other fashionable decorative styles such as Moorish and Gothic.

The Silver Studio opened at a time of increasing middle-class affluence, growing public interest in good design and the appearance of a whole range of journals to publicise the work of young designers and architects. Arthur was quick to take advantage of these circumstances. He exhibited at every Arts and Crafts exhibition from 1889 to 1896 and at international exhibitions including the World's Columbian Exposition in Chicago in 1893 and the Exposition Universelle Internationale in Paris of 1889. The studio's work was regularly featured in journals such as *The Studio* and *The Journal of Decorative Art*. Arthur Silver also lectured widely on design and contributed three chapters to Gleeson White's book *Practical Designing* (1894).

A successful design studio was bound to attract talent. In the 1890s these included two particularly gifted designers – Harry Napper (1860–1930) and John Illingworth Kay (1870–1950). Both made a speciality of designing textiles and wallpapers in the style that was to become known as Art Nouveau.

By the time of Arthur Silver's death in 1896, the Silver Studio was supplying designs to the leading manufacturers of Britain, the United States and Europe. Famous stores such as Liberty of London and Marshall Field of Chicago commissioned their own exclusive textile designs from the Silver Studio. Harry Napper subsequently ran the studio for two years, introducing Archibald Knox (1864–1933) as a part-time designer, who was responsible for many of the early designs for Liberty's Cymric Silver and Tudoric Pewter.

Rex Silver (1879–1965) took over the studio in 1901 with his brother Harry (1882–1972) as design manager. The two brothers continued their father's policy of providing superb designs to the world's leading manufacturers. From 1910 onwards the studio's output reflected the growing interest in both Britain and America in accurate reproductions of historic patterns, especially 17th-century needlework and 18th-century chintzes, and these exquisitely drawn designs became a mainstay of the studio's work until it closed.

Rex Silver was also determined to keep abreast of current design developments both in Britain and abroad. He collected the work of leading European designers and continued to participate in influential exhibitions such as the Paris exhibition of 1925. The studio produced some modern designs in the

Silver Studio: design for a wallpaper, c.1890

1920s and 1930s for the more design-conscious textile firms including Heal's and the Edinburgh Weavers.

Following the outbreak of World War II most of the designers left and the studio continued with only two full-time designers – Lewis Jones and Frank Price – and two part-timers, Madeleine Lawrence and Harold Bareham. By 1955, only Frank Price was left, and the studio worked largely for clients of long-standing – Lee Jofa in the United States and Warner, Sanderson, Liberty and G.P. & J. Baker in Britain. The Studio finally closed in 1963.

In 1967 Rex Silver's step-daughter Miss Mary Peerless, donated the entire studio contents and records to Hornsey College of Art, now part of Middlesex University, where the designs, wallpapers, textiles, business records and library are available for study and research.

Skidmore, Owings and Merrill (SOM)

American architectural partnership; established 1936

Skidmore, Owings and Merrill is one of the best-known and highly respected architectural firms of the post-war period. Founded in 1936, the original partnership was established by Louis Skidmore and Nathaniel Owings in Chicago. A New York office was opened in 1937 and in 1939 Skidmore and Owings were joined by John Merrill. By 1987, the firm employed 40 partners in seven offices throughout America and had gained an international reputation for the design of skyscrapers and office buildings whose distinctive high-rise form has done much to shape the appearance of the post-war city skyline. Two of the firm's most influential partners were the architect Gordon Bunshaft and the designer Davis Allen. Bunshaft was responsible for numerous International Style buildings from the 1950s while Allen supervised the design of the interiors. Both men fostered close links with the furnishing and design firms Knoll International and Herman Miller and together they developed a new, modern approach to office and corporate interiors that has been influential worldwide.

The Lever House (1950–52), designed for the multinational corporation, Lever Brothers, in New York was the first of Bunshaft's International Style buildings. The 21-storey exterior was in the form of a glass tower and was highly acclaimed as creating a new architectural image for New York businesses. The interiors incorporated many of the technical innovations that characterised post-war interior design and included modern services such as air-conditioning and electric cables which were placed behind suspended ceilings for ease of maintenance. The interior space itself was opened up to provide an unusually light and airy environment, with rows of desks and low dividing-screens replacing corridors and small office rooms.

The interiors of the Manufacturers Hanover Trust Company building, also in New York (1954), were even more innovative and included numerous dramatic effects. The great circular door to the bank vault, for example, was not hidden away in the recesses of the building but was displayed on the ground floor in full view of passers-by as if it was a magnificent piece of sculpture. Escalators took visitors up to the vast banking area which filled the whole of the building's main floor. This was furnished with elegant modern furniture, formally arranged in the manner of Mies van der Rohe, and single desks provided customers with a sense of privacy. An illuminated ceiling provided much of the lighting which was bounced off a screen of bronzed sheet-steel by the sculptor Harry Bertoia that completely covers one of the side walls. Features such as the use of high-quality materials, the regular gridded ceiling and the formality of the furnishings set the tone for many SOM interiors during the next two decades.

Numerous commissions for corporate headquarters in many parts of the United States followed, the most refined and influential of which was the Union Carbide building on New York's Fifth Avenue which was completed in 1960. The Union Carbide interiors were the ultimate in hard-edged, precision design. Conceived as a system of co-ordinated parts, the interior partitions and furnishings echo the rectangular pattern of

the illuminated ceiling which was divided into panels – each 5 feet by 2 feet 6 inches in size. Stainless steel framed desks and filing cabinets were arranged in long, regular rows that were precisely aligned with the lines of the ceiling grid. Hierarchies within the firm are reflected both in the size of the work stations and amount of privacy allocated, and also in the siting of individual offices with management occupying the top storeys and positions close to the windows. This was also the first office block to be fully carpeted in order to cut down noise.

The headquarters of the Chase Manhattan Bank, completed in 1961, was the first major interior commission to be supervised by Allen who worked closely with Bunshaft and David Rockefeller, the bank's chairman, in selecting the furnishings and colour schemes. The interiors appear more relaxed than previous schemes but still retain a characteristic air of formality. Rockefeller's office was furnished with modern seating designed by Ward Bennett and a fine collection of contemporary paintings and other works of art. The use of expensive materials, subtle lighting and the overall spaciousness of the room convey a sense of peacefulness and calm but the understated luxury of the interiors was nevertheless intended to underline the affluence and power of the bank.

As SOM expanded, other talented designers emerged whose work maintained the firm's reputation for rigour and quality but which also opened up different directions. The small printing works designed by Myron Goldsmith of the Chicago office for *The Republic* newspaper in Columbus, Indiana, for example, introduced a minimalist note that was highly appropriate for an industrial building. The printing machinery is showcased, rather than concealed, in a glass enclosure, a device that is elegant but at the same time frankly industrial.

The Boots Pure Drug Company Headquarters in Nottingham (1968) was designed jointly by SOM in Chicago and YRM in England and brought the best of American office design to England. The interior was largely open-plan and consisted of one large, tall room that was glazed on all sides. The height of the oak partitions was kept deliberately quite low – 5 feet 8 inches – so that anyone standing would have a sense of the vast space of the room but people who were seated could still work in a comparatively private enclosure. This arrangement is reminiscent of the domestic study carrel, transposed from the library to the workplace, and signalled the full-scale development of the highly organised open-plan office.

SOM's next trend was the development of the atrium. Partly as a means of introducing additional light, and partly to assist ventilation, the atrium represented a useful solution to the problem of deep plan offices that became increasingly fashionable in the 1970s and 1980s. One of SOM's earliest examples was incorporated in the Boise Cascade Home Office in Boise, Idaho where the glass-roofed entrance hall formed a great central space with four elevators clustered in the centre that gave access to the office floors. At First Wisconsin Plaza, in Madison, the atrium was in the form of a magnificent conservatory. The design of atria in later buildings followed diverse directions. At the Irving Trust Operations Center (1987) in New York a very cool space runs up the centre of an office tower, at the Crocker Center and Galleria in San Francisco Postmodern elements are introduced, and the atrium in the

Tenneco Employee Center (1982) in Houston includes lush vegetation, running water and fountains.

The work of the San Francisco office was rarely as hard-edged as that of the other offices and their designs for the Weyerhaeuser Company (completed in 1971), a timber firm in Tacoma, provided an opportunity to exploit the qualities of natural materials, especially wood. Designed by Chuck Bassett, the interiors employ staggered columns to create a softer effect and the use of wood and warm colours suggest an environment that is both friendly and welcoming. The furnishings for this building were provided by Florence Knoll. The Knoll Planning Unit had worked on several previous SOM projects including the interiors of the Connecticut General Life Insurance Company (1957) in Bloomfield whose open-plan design with movable partitions and ordered rows of work stations was a model of functional efficiency that served as the prototype for modern office buildings throughout America and Europe. An extension to the Weyerhaeuser Company building, housing laboratories and offices, was added in 1974 and develops the earlier wood theme. Here timber posts and glazed walls serve both as a barrier and a link between the inside of the building and the forest outside, and the interiors manage to convey a sense of softness without appearing folksy.

Certain projects have required specialist design solutions. The valuable collection housed in Yale University's Beinecke Rare Book and Manuscript Library (1963), for example, needed an environment where the lighting, heating and humidity levels could be precisely controlled, and Gordon Bunshaft's design incorporated glass-enclosed bookstacks that were individually air-conditioned. The five-storey building also has veined translucent marble panels that allow light to filter through the exterior walls providing a mysterious, warm and glowing light that underlines the rarity of the collection housed within.

SOM's work abroad provided additional opportunities for experimentation in design. The headquarters of the Banco do Occidente (1978) in Guatemala, for example, exploits local building traditions. Designed by Bruce Graham of the Chicago office, this building uses heavy construction, textured plaster, bleached white surfaces and ceramic tiled floors. In contrast, the design of the Agnelli Suite at the top of the Fiat Tower (1976) in Paris is sophisticated, cosmopolitan and expensively chic. It features reproductions of classic Mies van der Rohe furniture, travertine, rich woods and dramatic modern sculptures to suggest a sense of grandeur and luxury.

Skyscrapers

Widely regarded as a quintessentially American urban building type, the first skyscrapers appeared in New York in the 1870s. Numerous other examples were built in Chicago in the following decade and by the 1920s and 1930s skyscrapers were being erected at a great rate in almost every major American city. The earlier examples were sometimes adorned with Gothic spires or displayed classical ornamentation on their towering façades, but the architecture of the inter-war years was more modern in appearance, often borrowing the stepped ziggurat shape characteristic of Art Deco architecture and design. By the late 1920s elements of this style had come to dominate skyscraper interiors and the design of their foyers and public areas played an important role in the development and dissemination of American Art Deco. Moreover, skyscraper imagery also began to infiltrate the domestic interior in the work of furniture and textile designers such as Paul Frankl and Ruth Reeves. The post-war years saw the introduction of a more chaste aesthetic that owed much to the influence of International Modernism, but in recent years, the work of certain Postmodernist architects has demonstrated a return to the dramatic effects and rich materials reminiscent in spirit, if not in style, of an earlier age.

Originally the skyscraper was very much the product of new industrial materials and methods of construction. Its antecedents included the metal and glass Crystal Palaces of the 1850s, pioneered in London by the designer Joseph Paxton and in New York by the architects George Carstensen and Charles Gildemeister, and the cast-iron fronted buildings of the same period such as J.P. Gaynor's Haughwout Building erected in New York in 1857. The emergence of the skyscraper form was also made possible by several technological innovations of the mid-19th century, the most important of which were the manufacture of fire-proof steel structural members and scientifically planned foundations. The result was an open structural frame that was independent of its enclosure or envelope, that was modular in nature, and that could be enlarged and elongated to reach previously unheard-of heights. Equally essential to the viability of this vertical form was the development of the passenger elevator, and in particular the introduction of Elisha Otis's safety brake which did much to give the passenger peace of mind.

Many early skyscrapers were designed as offices rather than residential buildings. In speculative office buildings, interior design occurs at two levels: within the architect's office for the entrance lobby, elevator alcoves, rest rooms and elevator lobbies on each floor; and typically within separate design offices for leased space which is customised by the tenant. The earliest examples of the former level are in commercial buildings from the last two decades of the 19th century in Chicago.

Burnham & Root's Rookery, constructed in 1885–88, is a hollow rectangle in plan, with a central court crowned by a skylight. The same form is employed by D.H. Burnham & Company, the successor firm, in the Railway Exchange Building of 1904 and the People's Gas Building of 1910. In all three, renovations have added skylights at the top of the atria. In the Rookery a projecting semi-circular stair rises the height of the building, and a gallery rings the mezzanine level. In 1905 Frank Lloyd Wright renovated the ground floor, replacing iron railings with copper-plate and surfaces with incised gold-leafed

Skyscrapers: light fitting, City Hall, Kalamazoo, Michigan, by Weary and Alford, c.1930

marble; he installed Prairie Style sphere-and-flat-plane electroliters from the atrium roof and his signature urns at the foot of the grand stair.

Although the sculptural power of the masonry exterior of Chicago's Monadnock Building, designed by Burnham & Root and constructed in 1889–91, usually inhibits discussion of the building beyond its exterior, the interiors are not without significance. There is no central lobby but rather an axial corridor that bisects the main floor. Sheathed in gray-veined white marble, the walls rise above a highly polished floor; its naturalistic pattern is revealed in marble mosaic. Radiator grilles with Romanesque-style patterns, light fixtures and stair balusters are cast from aluminium, perhaps the first use of this material for such an application. Wooden sashes are painted to simulate the grain of oak.

In Holabird and Roche's Marquette Building, built in 1893–95, also in Chicago, the explorer Jacques Marquette's expeditions are illustrated in a series of mosaic scenes designed by J.A. Holzer and produced by the Tiffany Company in the double-height marble lobby. Above ground-floor and mezza-

nine-level elevator doors, bronze relief panels by Edward Kemeys illustrate French explorers and Native Americans.

Simultaneous developments on the West Coast of the United States are best summarized in Los Angeles in the Bradbury Building, designed by George Wyman and completed in 1893. Within its subdued walls, a skylight surmounts an atrium of foliated metalwork, tiled stairs, marble and open-cage elevators.

Several examples in New York illustrate the possibilities of surface richness. The lobby of Cass Gilbert's Woolworth Building, constructed as the world's tallest office building in 1913, contrasts dramatically with its Gothic-inspired terracotta exterior. The cruciform triple-height space has walls of gold-coloured marble quarried off the coast of Greece and broad stairways leading to the second-floor mezzanine decorated with murals of Commerce and Labor. Corner piers support a mosaic-lined Byzantine dome. Brackets contain bas-relief caricatures of Frank Woolworth counting his money, as well as of representations of the architect, builder, mortgager, rental agent and structural engineer.

The Chanin Building (1929) and the Chrysler Building (1928–29) represent high points in the Art Deco style. In the Chanin Building the interior decoration was overseen by Jacques Delamarre, head of the huge Chanin Construction Company, and includes lavish use of rich materials and costly details. Bronze relief panels above exit doors depict the spires of future skyscrapers, while diagonal etched lines in lobby storefronts indicate the edges of drawn curtains. Radiator grilles, first visible in the central vestibule, employ one of four distinctive patterns: spirals, waves and rays; set-back skyscrapers; an Islamic pattern; and an Art Deco pattern of volutes, lightning rays and sheaves of wheat. A gilded plaster figure within a relief panel sits above each grille. With capitals replaced by cantilevered light fixtures, fluted marble pilasters define the walls of the axial lobby. The plaster frieze is painted silver, and the bronze elevator doors illustrate geese formations. The decoration is no less opulent in the private areas, and the Executive Suite washroom is tiled in cream, gold and green with a gold-plated Art Deco sunburst over the geometrically engraved glass shower-doors.

William Van Alen's Chrysler Building is equally splendid and contains a triangular lobby with yellow marble in a chevron pattern on the floors, red Moroccan marble on the walls, and amber onyx and blue marble as trim, all chosen by Mr. Chrysler himself. Japanese ash, English gray hardwood and oriental walnut, combined with metal strips, make up the elevator door marquetry. At exits and above each of the four elevator lobby thresholds, vertical banks of white light take the form of raised curtains. Above, Edward Trumbull's ceiling depiction of Energy, Result, Workmanship and Transportation includes lines to represent natural forces as well as a portrait of the building itself. In contrast with the Modernistic themes of the lobby, a Tudor lounge opened off from a Georgian lobby in the tower-level Cloud Club.

In Warren and Wetmore's New York Central Building (now the Helmsley Building), completed in 1929, the lobby serves as a mid-block passage between two streets and as a connection to Grand Central Terminal. Gilt iron ornament and travertine are combined in the style of Louis XIV with jaspé oriental

marble. Clouds and sky are painted onto the ceilings of the red and gold elevator cabs.

Sheathed in red and gray veined marble, the main vestibule of the Empire State Building, designed by Shreve, Lamb and Harmon and completed in 1931, is three storeys high and 100 feet long. The double-height main corridor is ringed with shops and a streamlined bridge connects sections of the mezzanine. Sixty-two elevators ascend from the central core. The key decorative feature is a marble and aluminium wall mosaic in the form of a map of greater New York; it contains a rendering of the Empire State Building with the sun's rays radiating from its peak.

Such buildings transformed the Manhattan skyline and became potent symbols of the American nation's energy and prosperity. Skyscraper architecture was one of the few original American contributions to modern design that contemporaries could point to with pride and, perhaps not surprisingly, several designers looked to the urban environment as a source of inspiration for forms and ornamentation. Paul Frankl, for instance, developed a range of *Skyscraper Furniture* which featured the set-back, or stepped masses of skyscraper architecture, while Ruth Reeves's *Manhattan* textile pattern was a composite portrait of the city's skyline. At a time when the modern city seemed to exemplify the pace and dynamism of contemporary life, the use of skyscraper imagery proved immensely popular in avant-garde homes.

The chaste design principles of Modernists like Ludwig Mies van der Rohe that dominated the interior aesthetics of skyscrapers built after World War II eschewed many of the decorative features of the pre-war years. In the Seagram Building, designed by Mies with Philip Johnson and completed in 1958, pink-gray tinted glass stretches from floor to ceiling in each office. The installation of Venetian blinds with blades fixed at 45 degrees ensured visual uniformity from the outside. At the ground level, travertine flooring combines with pink granite on elevator shaft walls and the ceiling is mosaic.

Philip Johnson also designed a cathedral nave and side chapel inspired by the Italian Renaissance for 190 South La Salle Street in Chicago in 1987. Both have gold-leafed ceilings: the main space is barrel-vaulted and the secondary lobby is groin-vaulted. Imperial red marble contrasts with an off-white marble, and fluted pilasters terminate in terracotta Corinthian capitals.

Helmut Jahn's design for 120 North La Salle Street illustrates both the influence of his training under Mies and a fondness for rich materials. The building has a deeply rusticated polished black granite lobby that elegantly translates the exterior striated detailing, and at the height of the door lintels a brass strip lines the horizontal joint in the granite. Thus, contemporary skyscrapers, like many earlier examples, continue to include elegant materials and handsomely crafted details, and in so doing vividly express the wealth and power symbolised by these modern cathedrals of commerce.

Smith, George fl.c.1786-1826

British cabinet-maker and upholsterer

The cabinet-maker and upholsterer George Smith described himself as "upholder extraordinary to his Royal Highness the Prince of Wales" but none of his work for the Regent has been identified. He is far better known as the author of the important pattern book, *A Collection of Designs for Household Furniture and Interior Decoration* (1808), which was issued in three parts from 1805 and which became the most influential sourcebook for furniture and interiors of its time. It was the first book to illustrate designs for ordinary furniture in the Regency style and its 158 engravings provide a comprehensive guide to the furnishing of both grand and smaller houses. Moreover, by assimilating popular themes from other contemporary designers such as Charles Heathcote Tatham, Thomas Hope and the French designers Percier and Fontaine, Smith's

book helped to define and standardise the Regency style, encompassing all of its most characteristic motifs.

Smith's work was most clearly indebted to the designs of Thomas Hope, the wealthy collector and connoisseur whose own drawings for furniture had been published in the previous year under the title *Household Furniture and Interior Decoration* (1807). Hope's furniture was designed in the severe Greek and Egyptian styles and was based on archaeological sources that he had studied on his lengthy trips abroad. Much of his work was displayed in his London house which was opened to selected members of the public and which Smith almost certainly visited. But while Hope's book was aimed at a scholarly elite and illustrated only a limited amount of formal furniture intended for state rooms, Smith's success lay in making Hope's ideas accessible to a much wider, middle class audience by interpreting his designs within the full range of ordinary household articles. Unlike Hope's spare line drawings, Smith's engravings were also "elegantly coloured" to ensure a more direct visual and mass-market appeal.

Many of Smith's designs were in the Greek and Roman styles, but his concern for archaeological accuracy was never paramount, as can be seen in his design for a sarcophagus-style cellaret. He also included some furniture in the Gothic and Chinese styles. His designs have been criticised as being somewhat coarser and less refined than Hope's and they appear less fluid and more obviously rectilinear in form. Yet, they also reflect the practical experience of a working cabinet-maker concerned as much with comfort, utility and ease of manufacture as with purity of form. Favourite motifs include animal monopodia on the legs of tables, sofas and chairs. These were often derived from French sources, but Smith's animal feet are characteristically larger, more robust and carved with greater realism than those used by designers such as Percier and Fontaine – so much so that his furniture sometimes looks poised to walk away!

Smith did much to popularise the use of sofas and round dining tables. He also introduced the opening lotus bud at the base of table stems and developed the winged, lion-paw foot for the feet of tables and cabinets. Decorative motifs frequently included bolt heads and stars (copied again from Hope) which were used on the sides and fronts of chairs and on the aprons or friezes of tables and on ebony or brass stringing. His Gothic furniture designs were typically early Victorian and consisted of architecturally-inspired Gothic ornament grafted onto conventional contemporary forms. His interest in curtains, pelmets, and other drapery also anticipates the later Victorian passion for complex upholstery treatments. But his preference for bold, vivid colours such as crimson, mazarine and blue is wholly Regency and the illustrations in his book have proved particularly useful for modern restorations and recreations of Regency decorative schemes.

Smith also contributed designs and text to Rudolph Ackermann's fashionable periodical, *Repository of Arts*, in 1809. A second publication, *A Collection of Ornamental Designs*, appeared in 1812, and Smith's third and final book, *The Cabinet-Maker's and Upholsterer's Guide*, was published at the end of his life in 1826. In his last book, Smith lays claim to "experience of forty years devoted to the study of cabinet making, upholstery and drawing, both in theory and application" and states that he has been employed "by some of the

most exalted characters in the country to manufacture many of the Designs". But by this time, popular taste had moved on and Smith himself commented that many of his earlier designs were now obsolete. The 153 plates include interiors in his favoured Grecian, Egyptian, Etruscan, Roman and French styles but many of the designs tend towards the debased and over-elaborate ornamentation that was to be characteristic of much mid-century Victorian furniture.

NERIDA C.A. AYLOTT

Biography

Trained as a cabinet-maker; active from c.1786. Involved in two bankruptcies, 1790. Active in London as an upholsterer and cabinet-maker, 69 Dean Street, 1795–97 and 15 Princes Street, Cavendish Square, 1806–11; principal, Drawing Academy, 41 Brewer Street, 1826. Described as "Upholder and cabinet maker to H.R.H. The Prince of Wales, draughtsman in Architecture, Perspective and Ornaments", 1808, and "Upholsterer and Furniture Draughtsman to His Majesty", 1826. Published the influential pattern book, *Collection of Designs for Household Furniture and Interior Decoration*, 1808; contributed to Ackermann's *Repository of Arts*, January and March, 1809. Died in London, 1826.

Smoking Rooms

But for a few isolated examples (mentioned in Girouard, 1978), the Smoking Room was a 19th-century invention. The earlier examples followed a backlash against the free manners of the Romantic Bohemians of the 1830s, when men and women smoked in public without shame, and the latest were installed in the last years of the century, just before prejudice

against smoking for either sex again disappeared. The popularity of smoking rooms was not on account of tobacco smoking as such but because of the fashion for cigarettes, which had emerged in the 1830s and was greatly increased by returning soldiers who had acquired the habit from their Russian counterparts during the Crimean War, 1854–56. The tobacco was usually Turkish, Virginian being considered of lesser quality, and this coupled with the taste for the exotic encouraged by orientalist artists and designers, set the style of a Moorish or Arabian *divan* or parlour as the appropriate way to decorate the smoking room.

Smoking was not permitted in White's Club in London until 1845, and then only in certain rooms. When a proposal to extend this permission to the Drawing Room was put forward in 1866, it was defeated, and it is said that the Prince of Wales (later King Edward VII, and the man most responsible for making cigars fashionable) resigned his membership and founded the Marlborough Club in protest at the decision. The Marlborough Club was in Pall Mall, conveniently near his London house. The provision for smoking at Marlborough House was not very adequate, consisting of a glassed-in lobby leading from the Drawing Room out into the garden, and furnished, as convention demanded, with oriental bric-a-brac.

Prejudice against smoking in the reception rooms of a house remained widespread throughout the 19th century, and where there was no smoking room provided the unfortunate addict was expected to go outside. A *Punch* cartoon of 1855 entitled "Last Refuge of a Banished Smoker", shows a man seated in a horse-drawn cab, smoking a cigarette; his friend enquires where he is going and receives the reply "Oh! Nowhere! I've only hired him to have somewhere to smoke" (*Punch or The London Charivari*, 1855, p. 218). Apparently obsessed with the new phenomenon, *Punch* followed this four pages later with a representation of Othello, his armour discarded, reclining on a chaise longue and smoking a cheroot, above the quotation "O thou weed, Who art so lovely fair, and smell'st so sweet".

Queen Victoria strongly disapproved, and, according to a member of her household, when faced with a son-in-law who smoked, her solution was to designate a small room in the kitchen quarters as a smoking room, which she looked upon "as a sort of opium den". In contrast, the purpose-built smoking room, while still being kept at a distance from the reception rooms – at the end of a distant wing as at Mentmore or in a tower as at Cardiff Castle – was luxuriously appointed with upholstered banquettes for reclining and a ventilating system of grills concealed in the ceiling ornamentation. In fact there was a smoking room at Osborne House, the marine residence of Queen Victoria and Prince Albert on the Isle of Wight, included in the plan at the Prince's suggestion.

The smoking room was an extension of the male territory of the house and was often in the later 19th century situated near to, or en suite with, the billiard room. As well as the special room, a distinctive costume was deemed essential; something rather on the lines of an oriental dressing gown in the mid 19th century and in the 1880s a frogged smoking jacket with a round embroidered and tasseled cap, which still retained traces of the orientalist inspiration of the smoking environment.

An early example of a smoking room in the Turkish style was designed for Alexandre Dumas in his Renaissance-style

Smoking room in John D. Rockefeller House, New York, decorated by the New York firm Pottier and Stymus, 1880s

Château de Monte-Cristo in 1847. Its oriental character may well have been inspired by publication at about this date of two great exotic source-books, one English and one French. Owen Jones's *Plans ... of the Alhambra*, with its sumptuous gold-enriched colour plates, appeared in parts from 1836 to 1845 and Charles Texier's pioneering *Description de l'Arménie, la Perse et la Mésopotamie* was published in 1845.

Another route by which Europeans had become familiar with the decoration and furnishings of Turkish, Indian and Arab boudoirs was through the works of artist-travellers, notably J.F. Lewis, whose intensely sensual and romantic image of *The Harem* (c.1850, now in the Victoria and Albert Museum) was to haunt orientalist design for decades. These were followed by examples of national domestic architecture – often considerably idealised – installed at the recurring International Exhibitions from 1851 onwards. King Ludwig II of Bavaria, a great connoisseur of the exotic and opulent in any form, owned several Moorish-style kiosks, one of Parisian manufacture, acquired after it had featured at the International Exhibition of 1867, and a Moroccan house from the Paris 1878 exhibition, which he had set up at Linderhof.

A number of designs survive for Moorish or Arab kiosks with geometric polychrome decoration based on Hispano-Moresque inlaid work, and arched niches with scalloped edges containing long-necked rose-water sprinklers and highly ornamented hookah-bases. Although many of these are pattern book examples which may or may not have been carried out, devised, for example, by the celebrated designer Eugène-Alexandre Prignot in the 1870s, there is a Moorish smoking room for the Château Crêtes in Switzerland included by César Daly's in his *Décoration intérieure peintes* of 1877. A very late example of this type of "Alhambra" smoking room was installed in the Elizabethan-style Rhinefield Hall, a large house in the New Forest designed 1889–90 by Romaine Walker.

William Burges's designs dating from the early 1870s for the Summer and Winter Smoking Rooms at Cardiff Castle represent the apogee of exotic splendour in this branch of interior decoration. The schemes are eclectic, drawing from sources as diverse as Norse legends and Greek myths for the Winter room, with the signs of the zodiac forming the basis for the motifs in the Summer room. The rooms were conventionally sited in a tower, with a bedroom and bathroom, forming a separate male territory.

In the 1880s turned wood openwork frets and lattice-work inspired by Moorish screens and carved pierced wooden panels inspired by the stone screens in the Sidi Sayyid mosque at Ahmedabad in India were a recurring feature of the orientalist smoking room. It is hard to find smoking rooms with their exotic decoration intact in the present day. Examples like the Rhinefield Alhambra room survive unfurnished. However, one is completely preserved in the Brooklyn Museum in New York, the Smoking Parlour from the John D. Rockefeller house built in about 1880. By the end of the century the novelty of both cigarette smoking and Orientalist decoration had declined and smoking rooms were no longer a feature of modern houses. Lord Knutsford noted on a second visit to Sandringham in 1909 – his previous one having been in 1900 – that smoking was permitted in the Drawing Room, with the ladies and even the Queen herself indulging. The wheel has turned through its full circle and a return to the disapproval expressively outlined

by *Punch* in 1855 is evident; since modern houses are rarely big enough to include a smoking room, many people are reduced to the mid 19th century expedient of smoking on the terrace.

Smythson, Robert c.1535–1614

English architect

Robert Smythson was the most important architect in England in the 16th century; in fact, the only architect from that period known to us with any certainty. Little has been discovered of his career, nothing is known of his background or training, and the only evidence we have of his birthdate comes from his tombstone in the church at Wollaton, Nottinghamshire. Dated 1614, this says that he died aged 79 and that he was "Architector and Surveyour unto yee most worthy house of Wollaton with diverse others of great account".

It is from Wollaton and the other buildings with which he has been associated that we recognize him as one of the great early figures of English architecture. The first building where he is indubitably recorded is Longleat, Wiltshire, where from 1568 he worked as principal mason for Sir John Thynne, who had begun to rebuild an earlier house ruined by fire. It is not clear what Smythson did here, but many of the elements anticipate his later work, in the symmetry of plan, the area of wall space taken up by windows, and the aspect that historians speak of as the extroversion of the house and the way it seems to relate to the countryside around it. Longleat's Great Hall has a stone floor and fine hammerbeam ceiling.

Smythson's first independent building was Wollaton Hall, built in the 1580s for Sir Francis Willoughby with many of the features of Longleat but executed with more vigour and boldness. The plan has a central Great Hall in place of a courtyard, three storeys high, lit and ventilated from above with clerestory windows above the surrounding apartments. This comes, perhaps, from the design of Poggio Reale, built in Naples by Alfonso V in the mid-1400s and published in Sebastiano Serlio's *Libri di architettura* (1550), as does the hall's Doric fireplace and hammerbeam roof slung from the ceiling, where a system of morticing short timbers in a grid pattern enabled

the width to be spanned. The exterior, with its cartouches and gables, echoes the type of ornamentation found in Vredeman de Vries's *Variae architecturae formae* (1560, enlarged 1601), as do many of the interior details, most obviously the strapwork panels and the metopes of the screen in the Hall. Figures in its arch spandrels came probably from French choir screens. The result is a pastiche, perhaps, of local and Italian sources, but done with such vigour and so well that, were there no names in the account books, we might say it was carried out by craftsmen from the Continent.

Smythson settled in Wollaton and much of his later work was done in this part of the Midlands. Barlborough Hall, Derbyshire (1583), Worksop Manor, Nottinghamshire (1585), Doddington Hall, Lincolnshire (1593–1600), Welbeck Abbey, Nottinghamshire (1597), Burton Agnes Hall, Humberside (1601–10), and Chastelton House, Oxfordshire (1602), all bear the marks of his particular way of designing, even if there is little documentation to connect directly to him. The red brick Burton Agnes Hall has some magnificent ceiling panels, a carved stone screen and matching chimneypiece in the Great Hall and an oak staircase. The ceiling of the wagon-roofed Long Gallery which runs the length of the front is richly plastered and decorated with scrolls of roses, with a running design of honeysuckle on the ceiling of the Oak Room.

The best known of Smythson's later designs is that for Hardwick Hall, Derbyshire (1590–97), built for Elizabeth, Countess of Shrewsbury ("Bess of Hardwick"), to replace an older, smaller house. The new Hardwick is a house of great romantic beauty, although Nikolaus Pevsner considered some of the interior plastering coarse. The front and back are marked by ranges of windows (an old rhyme goes "Hardwick Hall, more glass than wall"), the towers at each end recalling the effect of the ornamental skyline at Wollaton. The interior, which is well-preserved with tapestries and elaborate plasterwork, is a striking example of Smythson's working combination of medieval chivalric design and the newer forms of organization and ornamentation available from the volumes of Serlio and Vredeman de Vries. Yet the plan, seen in itself, especially in the placing of the hall on the main axis, seems to come from something purely classical, like Palladio's design for the Villa Valmarana at Lisiera. And for all the rich detailing, Hardwick has something of the restraint seen in Smythson's first work, more than a decade earlier, at Longleat. There is, however, a definite element here of medieval architecture. We know from Smythson's drawings how much he looked at Gothic designs, and it seems not inappropriate here to see Smythson's architecture in context with a contemporary work like Edmund Spenser's *The Faerie Queene* (1590). The Hall has a screened passage at one end, forming a lobby, a bay window and dais at the other. State rooms are situated at the top of the house, apartments for the family on the first floor, and servants' quarters chiefly on the ground floor. A stone staircase leads from the Hall, past the first-floor drawing room with its plaster relief over the door, a bust of a man in armour, to a large and light High Great Chamber, specially designed to show off the tapestries, the originals of which are still there. A painted plaster frieze above, with moulded figures in rural scenes by Abraham Smith, depicts the Hunt of Diana. The bay window walls are panelled to the top cornice and there is a fireplace of alabaster and Derbyshire marble, depicting the

Royal Arms, by Smith. Beyond, in the Long Gallery which runs the full width of the house, are two large fireplaces loosely based on Serlio's designs, with coupled banded pilasters, black columns and strapwork surround. The 13 Flemish tapestries were bought by Bess herself.

Smythson's designs, especially at Wollaton and Hardwick, have a daring and grandeur, and if his name came to be forgotten, the power of his architecture was recognized, at least by a few. Nicholas Hawksmoor said of Wollaton that it contained "some true strokes of architecture" and later Uvedale Price in his *Essays on the Picturesque* (1810) was to say that in its ornaments and massing it was a house that yielded "to few, if any, in the kingdom". With the revival of the Gothic and the idea of the old English home in the 19th century, we find in books like J.P. Neale's *Views of the Seats* (1819–20) and Joseph Nash's *The Mansions of England in the Olden Time* (1839–49) the work of Smythson praised and illustrated again. This was the time of the so-called Jacobethan revival and in Mentmore, Buckinghamshire, built in the 1850s by Joseph Paxton and George Henry Stokes for Baron Meyer de Rothschild, we have an obvious replica of Wollaton, at least in plan and profile. A version of Mentmore was then built for Baron Rothschild, also by Paxton and Stokes, in the late 1850s, in Ferrières.

Smythson's son John followed in his father's footsteps, working with him at Bolsover Castle, Derbyshire, for Sir Charles Cavendish in the early 17th century. This building continues the style of Elizabethan medievalism, with particular details, like the hooded fireplaces, coming from Serlio. There is a vaulted Gothic hall with hooded fireplace, and stone staircases lead to small rooms with painted ceilings and elaborate chimneypieces of marble and alabaster. In the Pillar Parlour the stone-flagged floor is honeycomb-patterned and horses' heads are carved on the bosses of the vaulting. John Smythson remained at Bolsover to work for the Cavendishes all his life, most notably at Welbeck (1623), and Ogle, Northumberland (1629). He died in 1639, and it was probably through his agency that all the drawings by Robert Smythson we have, now in the library of the Royal Institute of British Architects, were preserved.

DAVID CAST

Biography

Born in England, c.1535. Married: son was the mason and architect John Smythson. Worked as principal mason for Sir John Thynne, Wiltshire, from 1568; active at Wollaton Hall, 1580s, and at Hardwick Hall, 1590s; settled in Wollaton. Died in Wollaton, 1614.

Selected Works

A large collection of Smythson's drawings is in the Royal Institute of British Architects, London.

Interiors

- 1568–80 Longleat, Wiltshire (completion of the building and interiors)
- 1580–88 Wollaton Hall, Nottinghamshire (building and interior details); Sir Francis Willoughby
- 1585 Worksop Manor, Nottinghamshire (building and interiors)
- 1590–97 Hardwick Hall, Derbyshire (building and interiors): Elizabeth, Countess of Shrewsbury
- 1601–10 Burton Agnes Hall, Humberside (building and interiors)

Soane, John 1753–1837

British architect

The son of a bricklayer, John Soane decided to become an architect at the early age of fifteen. He entered the service of George Dance the Younger in 1768, enrolled at the Royal Academy Schools in 1771, and worked in the newly-formed practice of Henry Holland from 1772. Two years of travel in Italy followed between 1778 and 1780, and on his return to England Soane embarked upon a career as one of the country's most highly-respected and successful architects. Initially influenced by an interest in French Neo-Classicism, Soane's style was nevertheless marked by an increasingly “modern” treatment of neo-Palladian themes, without homage to classical proportions. And, combining an original synthesis of lighting and structure, with a novel interpretation of architectural detail and interior decoration, many aspects of his work anticipate the new classicism of Postmodern built environments.

Soane's first commissions came mainly from the contacts he had made with fellow Grand Tourists in Italy and consisted principally of country houses, lodges and outbuildings. His early works, including for example, Letton Hall (1783), Saxlingham Rectory (1784), Shotesham Hall (1785), Ryston Hall (1786), all in Norfolk, Blundeston House (1786) in Suffolk and Sydney Lodge (1789) in Hampshire, were characterised by a restrained Neo-Classicism, with flat unadorned façades and the rather hesitant use of columns and pilasters.

As both his reputation and his practice grew Soane bought his first house in Lincoln's Inn Fields (No. 12), demolishing the existing building and replacing it with the present one. In 1788 he was appointed Architect and Surveyor to the Bank of England and in 1791 he began the Bank Stock Office, a seminal building in the Soane canon. Although he was to be involved in the redevelopment of the Bank of England site for more than forty years, it was the Bank Stock Office that established many of the features of Soane's distinctive interior style. The most distinguishing theme was the use of the top-lit domed ceiling, springing from segmental arches which were in turn

supported by four corner piers. He had first used this “pendentive” dome a few months earlier at Wimpole Hall where it provided a solution to an awkward T-shaped site, wedged between existing rooms. But it was at the Bank Stock Office – again a difficult site – that Soane established its enduring principles. A ring of glazing provided the top lighting and the internal decoration reflected classical themes: fluted pilaster-strips imitating columns, a thin entablature (cornice), in this instance consisting of a Greek key design and plaster roundels, all became features of Soane's later work.

A derivative of the top-lit domed ceiling theme was the shallow-dished ceiling with cross vaults in place of dome and top lighting or lantern. The Breakfast Room at No. 12 Lincoln's Inn Fields is an early example where the ceiling was painted with a flower-entwined trellis and familiar incised lines appeared on the arch soffits. This treatment was to be repeated in the Library at Soane's country house, Pitzhanger Manor (1800), and in the North Drawing Room at No. 13 Lincoln's Inn Fields (1812).

The tribune or atrium, rising through a number of floors and topped with a roof lantern was a further development of Soane's ideas for introducing natural light into architectural spaces. Soane first used this at Tyringham Hall, Buckinghamshire (1792); he employed this treatment again at Pitzhanger Manor and at the National Debt Redemption Office of the Bank of England (1817). And whether it was introduced for practical or for aesthetic reasons, the use of top-lighting in all its various forms gave Soane's buildings much of their particular personality and was an important interior decorative theme in its own right.

Soane also liked to use rustic, or primitive materials in the construction and decoration of his buildings. This “primitivism” was a response to the writings of Abbé Laugier and his *Essai sur L'Architecture*, published in English in 1755. Its first appearance is in the design for a dairy at Hamels Park, Hertfordshire (1783), where he incorporated bark-covered tree-trunks as columns with a rebated cap under the square abacus (flat coping supporting the cross-beam). Further examples are the brick and flint columns of the gateway to Pitzhanger Manor and, more importantly, the overall simplicity of the Dulwich Picture Gallery (1811), built of stock bricks with simple cornice and frieze decoration. Laugier's essential principle was that all architectural features should have a reason for existing and should not be purely decorative. This led Soane, in his Royal Academy lectures, to criticize some of his own buildings, principally the Princes Street Vestibule of the Bank of England (1802).

In 1812 Soane purchased No. 13 Lincoln's Inn Fields, a larger house than the one he occupied next door. Again, he demolished the existing house and erected the present building with its unusual Portland stone façade. This purchase, the result of Soane's growing art collection and the sale of Pitzhanger Manor, now houses Sir John Soane's Museum. It provides a microcosm of the Soane style – cross-vaulted ceilings, segmental arches, a “tribune” with domed ceiling, lantern lights, a colonnade and a profusion of relaxed Neo-Classical decorative features. The interior decoration, as at Pitzhanger, owes much to Soane's time in Italy. Walls are variously marbled, grained to resemble satinwood, or painted a deep Pompeian red; incised lines decorate arch soffits; mirrors, on

Soane: vestibule, Aynho Park, Northamptonshire, 1800; watercolour by J.M. Gandy

the walls and as backing to wall niches, are used to broaden perspective and reflect light. This play of light, enhanced by coloured glazing, is one of the enduring beauties of the interior, which also contained some elegant Neo-Classical furniture that may also have been designed by Soane.

The last years of Soane's life were devoted to designs for public buildings, mainly in Whitehall and Westminster. Commissions included new rooms and refurbishment at Nos. 10 and 11 Downing Street (1824) and the restoration of the façades of Inigo Jones's Banqueting House (1828). The

completion of the New State Paper Office in 1834, overlooking St. James's Park was Soane's last major work. In recognition of his services as an architect he received a knighthood from William IV in 1831.

Many elements of Soane's style were prefigured by George Dance, with whom he had begun his career, but Soane always demonstrated a willingness to depart from purely traditional themes. Combined with a meticulous attention to detail, it resulted in that highly personal style which so effectively amalgamated the architectural and decorative elements of his buildings into a cohesive whole.

NICHOLAS NUTTALL

Biography

Born at Goring-on-Thames, near Reading, 10 September 1753, the son of a bricklayer. Entered the offices of George Dance Jr., City Surveyor, 1768; admitted to the Royal Academy Schools, 1771; awarded a gold medal, 1776. Worked in the offices of the architect Henry Holland (1745–1806) 1772–78; travelled in Italy 1778–80. Married Elizabeth Smith, the niece of George Wyatt, 1784 (died 1815). Worked in his own architectural practice from 1780; surveyor to the Bank of England, 1788–1833; appointed Clerk of Works at Whitehall, Westminster and St. James's, 1791; Clerk of Works to Chelsea Hospital, 1807; architect to the Board of Works, 1814–32. Elected Associate of the Royal Academy of Arts, 1795; Member, 1802; Professor of Architecture from 1806. Gold Medal, Royal Institute of British Architects, 1835. Published many pamphlets and books on architecture; left his house in Lincoln's Inn Fields and its contents to the nation as a museum. Knighted 1831. Died in London, 20 January 1837.

Selected Works

A vast collection of drawings and manuscript material, including account books, notebooks, correspondence, designs and office papers is in Sir John Soane's Museum, London. Another large collection of drawings is in the Victoria and Albert Museum, London, and additional manuscripts are in the Bodleian Library, Oxford. A full list of Soane's buildings appears in Bolton 1924, and Colvin 1995.

Interiors

- 1784–86 Tendring Hall, Suffolk (alterations including new drawing room and dining room): Sir Joshua Rowley
- 1785–88 Shotesham Park, Norfolk (building and interiors): Robert Fellowes
- 1787 Fonthill House, Wiltshire (picture gallery): William Beckford
- 1788–89 Bentley Priory, Middlesex (alterations and additions including the library, drawing room, music room, breakfast room and tribune, and entrance hall): 1st Marquess of Abercorn
- 1789–98 Sydney Lodge, Hamble, Hampshire (building and interiors): Hon. Mrs. Yorke
- 1790–93 Wimpole Hall, Cambridgeshire (alterations and additions including yellow drawing room and book room, dairy and lodge): 3rd Earl of Hardwicke
- 1790–95 Buckingham House, Pall Mall, London (alterations to exterior and interiors including new hall and staircase and principal reception rooms): 1st Marquess of Buckingham
- 1791–1833 Bank of England, London (rebuilding, interiors and furnishing of the offices and rooms): The Governor and Court
- from 1792 12 Lincoln's Inn Fields, London (remodelling and alterations): John Soane
- 1799–1804 Aynho Park, Northamptonshire (alterations and additions): Richard Cartwright

- 1800–03 Pitzhanger Manor, Ealing (rebuilding; new interiors including front and back parlours, trellis library, glazed gallery and Monk's dining room): John Soane
- 1804–06 Port Eliot, St. Germans, Cornwall (remodelling and interiors): 2nd Lord Eliot
- 1805–06 Stowe, Buckinghamshire (Gothic Library and vestibule): 1st Marquess of Buckingham
- 1809–11 Moggerhanger, Bedfordshire (building and interiors): Godfrey Thornton
- 1811–14 Dulwich Picture Gallery and Mausoleum, Dulwich (building and interiors): Master and Warden of Dulwich College
- 1812–13 13, and later 14, Lincoln's Inn Fields, London (rebuilt and remodelled; added Picture Room and Monk's Parlour): John Soane
- 1822–27 House of Lords, Westminster, London (royal entrance, royal gallery, library and committee rooms): Office of Works
- 1823–27 Board of Trade and Privy Council Offices, Whitehall, London (building and interiors): Office of Works
- 1826–31 Freemason's Hall, Great Queen Street, London (Council Chamber)
- 1830–34 State Paper Office, Duke Street, London (building and interiors): Office of Works

Sofas and Settees

A sofa is a seat with back and arms, designed to be used by more than one person. The sofa may be defined as an informal settee that encourages lounging and reclining, while the settee is often a more formal item. Sofas have customarily been fully upholstered, while settees were often made with open frames and cushions. The settee was superseded by the sofa in the 19th century when domestic habits began to grow more informal.

The variety of sofas and settees is enormous in terms of materials, techniques and decorative detail. Seats and backs might be upholstered or plain; they might be conjoined chair backs or framed upholstery; they could be simple and plain or highly decorative. Like chairs they could also be ceremonial or functional.

This form of seating seems to have evolved from the couch which could double as a bed at night and a seat during the day. Indeed the development seems to have taken two routes; one as a day bed and the other as a couch or sofa. Whereas the day bed was usually intended for single occupancy, the couch soon became used for multiple occupancy. With built-up sides to support cushions, and the provision of a back, the shape that is still common today was thus defined. These double-ended daybeds are sometimes known as Knole sofas, after the prototypes supplied to the house of the same name. They are often fitted with ends that let down on ratchets or with protruding pegs that are held with large bullion ropes.

By the end of the 17th century the sofa was quite magnificent, as the examples supplied to the Duke of Leeds (Temple Newsam) show. Settees by William Kent included solid hall seats with carved scroll arms, and an upholstered type in velvet or damask with parcel gilt and mahogany, or gilded-gesso frames. The second half of the century saw the introduction of *confidantes*, settees with seats at each end with upholstered divisions between them.

The early 18th century saw the introduction of the chair-back settee which remained popular through much of the

century and was revived by Hepplewhite in the 1780s. It is important in that it confirmed the idea of suites of upholstered furniture, which have remained the norm ever since. The popularity of the suite has been consistent.

The epitome of the sophisticated elegance of 18th century sofas can be seen in the Philadelphia sofas produced during the mid-century. With rolled arms, scrolled backs, cabriole legs, and in some cases no stretchers to interfere with the shape, they are still reproduced today. On the other hand, some sofas were not designed especially for use. The decorative value of furniture in interiors, was often exploited by architects such as Kent. His sofas for Wilton House are examples of this ceremonial and architectural effect.

There was a growing distinction between the elegant formality of settees in English and English-influenced interiors, and the French taste for comfort, although both stylistically tended to follow the prevailing taste. In France this difference in approach resulted in a wide range of upholstered sofas. The *canapé* was the basic French sofa or settee, while a *canapé à confidant* meant a sofa for two. The term *confidant* refers to two different sofa types; one where the ends curve forward so that two people would be half-facing, and the other which had small triangular seats outside the arms at each end. Other terms for this type are the *marquise* or the *tête à tête*.

Other shapes included the ottoman (*sultane* or *turquoise*) which was a sofa built in an oval shape with one higher end, while the *méridienne* sofa also had one end higher than the other, but was made during the Empire. It was sometimes designed with an end that would drop down. The *causeuse* was a type of small settee, corresponding to the English love-seat.

During the Regency and Empire periods, the couch often employed an arm piece extending down from the head to half way along the back, in the manner of a Roman or Greek model. The chaise-longue, closely resembling a day bed, was an elongated chair with upholstered back and arms. Sheraton illustrates it, as does George Smith and the Nicholsons call it "a kind of sofa". By the mid 19th century it had shed its arms and become a reading seat or Albany sofa.

The Regency period also saw a different version of the ottoman. Introduced in the late 18th century from Turkey and illustrated by Sheraton, Hope, and Smith, it was effectively a long upholstered seat. In some cases it was fitted to a room or a corner and could have been a forerunner of the upholstered cosy corner. Americans were very fond of ottomans in the mid 19th century.

The 19th century is often considered as the high point of the upholsterer's art, both in terms of use of materials and of technical virtuosity. The invention of interior springing systems meant a completely new look to the profiles of sofas and chairs, and when this was combined with a demand and taste for substantial and opulent furnishings, in items like pouffes, *crapauds*, *confidantes*, *indiscrets*, *canapés de l'amitié*, the upholsterer's art was being expressed at its peak.

One way of displaying the value of a piece was in the technique of buttoning. Examples of forms that suited this technique included the borne, a usually large circular or oval seat, designed for a number of users at any one time. It was often deep-buttoned with a central cone for displays and was popular in common rooms or foyers in hotels, as well as private houses. The other example of buttoning is usually

Sofa from Rudolph Ackermann's *The Repository of Arts*, 1828

Sofa by Gilbert Rohde, 1939

found in the chesterfield, a double-ended overstuffed couch which had a number of variations but was often deeply buttoned. Another technical advance that affected sofas and chairs was an invention by Henry Belter. With his method of making chair and sofa frames from bent plies of wood, extravagant Rococo revival designs could be produced in amazing forms.

In the 20th century the sofa has continued to reflect prevailing styles, but in terms of form it has varied quite dramatically. This would appear to be not only related to the fast-changing attitudes to some furniture design, but also to the impact of new materials. The use of metal for frames, latex and polyether foams for cushions, and other sophisticated materials for the secondary parts of sofas and chairs has brought about a complete re-evaluation of the nature of upholstered furniture, in conjunction with a continuance of traditional styles.

At the beginning of the century, sofas varied from the Art Nouveau which delicately imitated the 18th century *canapé* shape to the severe and box-like Arts and Crafts pieces produced by Gustav Stickley and Carl Larsson. Alongside these shapes were myriad reproductions from all historical periods, as well as a whole range of comfortable but nondescript upholstery items. By the 1950s the possibilities of latex foam, rubber suspensions, and flexible fabrics meant that the style of the period could be reproduced in upholstery. The curved sofas by Kagan or Noguchi, and Zanuso's *Lady* chair and sofa, illustrate the sculptural look that the new materials could interpret.

The taste for elemental shapes, established by the Modernists in the 1930s, continued into the 1950s and 1960s with architects and designers producing ranges of settees that were simply open frames with squared cushions upon them. These were adaptable to many situations, especially in office furnishings.

Although contemporary unitised seating found a popular market for a while, for much of the second half of the century the general public were using the three-piece suite as their main lounge furniture. Yet again these could reflect a taste for the modern, perhaps in elegant wooden show frames with square tweed cushions, or they might reflect a desire for being deep-buttoned, covered in velvet, and made with large proportions. As fashions have changed, the country house or cottage look has been revived with chintz loose covers or cotton prints

Avant-garde designers during the period experimented with the new opportunities provided by foam upholstery, and works by designers like Olivier Mourgue, Joe Colombo, and Vico Magistretti were icons of the 1960s. In the late 1970s and early 1980s settees were also part of the repertoire of Postmodern designers. Hans Hollein and Alessandro Mendini have been instrumental in reworking the traditional shapes by introducing Postmodern themes.

Sonck, Lars 1870-1956

Finnish architect and designer

The architect Lars Sonck was one of the main proponents of the National Romantic style in Finland at the turn of the century. Although he designed furniture and interiors himself, few drawings survive, and while photographs exist of some of his interior work, much has been altered or no longer survives. Many of the interiors of his buildings were in fact designed or at least decorated and furnished by others. However he provided the spaces and structural elements which to a large extent determined the overall impact of the interiors.

Two distinct groups of work need to be considered: first, the log buildings, mainly villas, which Sonck continued to build right through his career, beginning in the 1890s; second, the stone buildings, mainly public buildings and many of them modern building types. His churches can be seen to influence his secular work. Each group exemplifies a different aspect of National Romanticism.

The log villas show most clearly the influence of the vernacular, and particularly "Karelianism", the 19th-century search for Finnishness in the traditional architecture and folk art of the Karelia region of Eastern Finland and Western Russia. Although Sonck himself had to abandon his plans to accompany Blomstedt and Sucksdorff on an 1894 visit to Karelia, he was subsequently able to see the photographs and drawings produced and later published by them on the architecture of the region. Their aim had been "to search for and collect popular national motifs, which could serve as a foundation for a national timber style of architecture" (Y. Blomstedt and V. Sucksdorff, *Karjalaisia rakennuksia ja Koristemuotoja Kuvakeräyksiä Keskeisestä Venäjän Karjalasta*, Helsinki, 1901). It was to be Sonck, along with Akseli Gallen-Kallela, who produced the first manifestations of this new style. His *Lasses* villa of 1895 has the typical horizontally boarded wooden interiors, with large square windows having carved and decorated

Sonck: main stairway, Telephone Building, Helsinki, 1905

frames, knotty timber doors with notched and incised designs, roughly ornamented furniture, and brick ovens all believed to derive from Karelian examples. However, many of these elements and others, such as his increasingly freely planned spaces divided by low walls (Pirtinniemi and Finnvilla, both 1902), were also influenced by the architecture of other Scandinavian countries, English Arts and Crafts architecture (especially Baillie Scott), American architects such as H.H. Richardson and, more exotically, Japanese sources. Ainola, built for the composer Sibelius from 1904, with its south-facing, ground floor living / dining room, study and library of harmonious proportions and beautifully crafted detailing, is far removed from peasant traditions.

By 1900 there was a search for an original and expressive vocabulary to symbolise Finnish character in all forms of architecture and design, not just vernacular timber buildings. In Sonck's work, as well as that of other exponents of National Romanticism, such as Eliel Saarinen, this vocabulary was a synthesis of the influences mentioned above, as well as those of central Europe (particularly Vienna and Hungary) and medieval Finnish buildings, combined with original ideas. It commonly took the form of severe, massive and primitive stone construction, with interiors where a richness of decorative detail, carved and painted with simple stylised forms derived from nature, contrasted with otherwise plain walls. Rough and polished granite and soapstone, as well as wood, provided contrasting textures.

Typical of this style are the Helsinki Telephone Company building, the Eira Hospital and the Privatbanken interior, all in Helsinki, as well as the Church of St. John in Tampere, all of which Sonck was working on during the years 1903 to 1905. They were strongly influenced by his 1890s studies of medieval Finnish and German churches. This medievalising is hardly appropriate for the modern and technological functioning of a telephone exchange and its offices. The labyrinth of rooms, with cave-like openings for windows, and a rough walled exterior, was criticised at the time as having an alien and archaic appearance. However the stairway rising through all floors, with its combination of materials and textures, stone, wood and riveted metal and simple abstract decoration, seems modern and elegant. It is typical of those found in his other buildings of this period.

The Eira Hospital was intended to provide a comfortable and welcoming interior, more like a country house than a hospital. Its irregular plan with a variety of room shapes helped achieve this. The woodwork was varnished rather than painted, to avoid a clinical effect. Medieval churches and manor houses were the source for circular stair towers and window bays and for the vaulted ceilings with their painted decoration.

The Privatbanken was built as a banking hall occupying the courtyard of an existing Neo-Classical building. It is one of Sonck's most impressive interiors, consisting of a central arched, nave-like space with arcaded aisles each side. The top-lit central space apparently derives from a near contemporary Swedish bank interior by Gustaf Wickman, but again shows medieval influence. The stout granite columns of the arcades are partly rough and partly smooth, some with block-like capitals carved with animal heads and some engraved with abstract designs. These were designed by Valter Jung (1879–1946),

Sonck's collaborator, who also designed built-in hardwood banking counters and benches around the lower part of the columns (no longer in place), integrating the various elements of the interior. The current colour scheme, apparently based on the original, is of grey and pastel coloured walls with slightly darker painted decoration on the inside of the arches with the moulded plaster decoration around the tops of the walls in the central room picked out in white. This combines with the pale granite to create a very light interior. It has similarities in its geometric decoration and colour scheme to the bolder Jugendstil interior, completed in 1905 by Max Frelander, of Sonck's St. Michael's Church in Turku. However, in places it has classical detailing and it has been suggested that the overall effect may have been deliberately attuned to the Neo-Classical exterior of the building. In contradiction, the anthropomorphic touches are more evident here than in any other of Sonck's interiors.

The Privatbanken interior represents the peak of the National Romantic style but contains within it the seeds of the change to a more modern classicism. From 1904 onwards there was considerable criticism of National Romanticism as anachronistic and, with its symbols of primitive nature, not appropriate for the age of the machine. There was a dramatic change in Sonck's work around 1907, with a new emphasis on symmetry and classical detailing, as shown in the Mortgage Society building of 1907–08. Its original interiors show a contemporary Viennese influence, and as part of the interior was designed by Sigurd Frosterus, one of the critics of the National Romantic style, this is not surprising.

The Stock Exchange of 1911–12 takes this change further. In its glass covered, brick and stucco inner courtyard particularly, Viennese elements are combined with others from contemporary buildings such as H.P. Berlage's Amsterdam Stock Exchange and Martin Nyrop's Copenhagen Town Hall, together with Louis Sullivan style ornamentation. Although derivative, it points the way to a successful new style based on an elegant and restrained monumentalism which anticipates developments of the 1920s. Sonck's other office buildings, apartment blocks and even some villas after this time show the same change, but the distinctiveness and power of his earlier work is lacking. It is only maintained in the log buildings he continued to build to the end of his career in the 1940s.

DIANA HALE

Biography

Lars Eliel Sonck. Born in Kelvi, Finland, 10 August 1870. Studied architecture at the Polytechnic Institute, Helsinki, graduated 1894. Established private architectural practice, Helsinki, 1894. A leading member of the National Romantic Movement. Published several articles on architecture and design. Died in 1956.

Selected Works

The Lars Sonck Archive, containing photographs, drawings and some manuscript material is in the Museum of Finnish Architecture, Helsinki. A list of other archive sources and collections appears in Korvenmaa 1991.

Interiors

Sottsass, Ettore, Jr. 1917–

Italian architect and interior, exhibition, furniture and industrial designer

Ettore Sottsass is one of the most important designers of the 20th century and his work and ideas have played a central role in the rejuvenation of furniture and interior design in Italy

since the 1960s. Born in Austria in a region that was returned to Italy after World War I, he followed in his father's footsteps as an architect and graduated in 1939 from Turin Polytechnic. It was certainly an interesting location for a young student, for as a city Turin was at the heart of Italy's Modern Movement, from the International Exhibition of 1901 to the establishment of the Fiat factory and the construction during the 1930s of Mussolini's architectural and industrial projects. In 1939 Sottsass was drafted into the army and after the liberation moved to Milan to establish his own architectural practice. Sottsass still lives and works in the city.

In 1945 Italy began a process called the *Recostruzione*, a break with the political Fascist past, a commitment to a new Italy. It led to a flowering of Italian design and style in the 1950s, producing design icons such as the Vespa scooter and the Piaggio espresso coffee machine. Milan was placed at the centre of these radical changes. The city launched the Milan Biennales which provided an international forum for Italian designers to exhibit their work. It led to the establishment of influential magazines such as *Domus* and then *Casabella* and *Modo* that quickly attracted an international readership. Milan provided a creative and stimulating atmosphere for the young Sottsass to develop his skills and ideas. Italian design education, then and now, was centred on architectural training, and although Sottsass worked on building projects such as the American Marshall Plan funded INA-Casa scheme he very soon began to specialise in interior design, exhibitions and later furniture, ceramics, sculpture and art pieces.

During the 1950s he quickly established himself as one of Italy's most important young designers. He attracted the eye of George Nelson, and for a brief period worked in America, but his roots and culture were strongly Italian and he returned to take up a job as design consultant to Olivetti. It was the start of a long collaboration with the company and a pattern of working on a freelance basis with many of Italy's leading manufacturers including Friade, Zanotta and Artemide.

The 1960s was a particularly important period for Sottsass. Milan became a centre for the culture of Pop that opened up a new aesthetic which challenged the prevailing Modernist approach. Sottsass was part of a movement that included Archizoom, Superstudio and UFO that established Milan as a laboratory for the avant-garde. In the mid 1960s anyone wanting to keep an eye on the leading edge had to read the pages of *Domus* magazine. The atmosphere of this period is evoked in a book called *The Hot House*, written by Sottsass's contemporary and friend Andrea Branzi. *The Hot House* describes the work of the main protagonists of this new mood including Andrea Branzi, Gaetano Pesce, Studio Alchimia and Alessandro Mendini. Their work redefined the function of colour, decoration, materials and form for a whole generation and effected a revolution in the way designers and the consumer viewed the domestic landscape.

During the 1960s Sottsass produced a whole series of seminal objects, a series of cupboards, for example, using plastic laminates and blood-coloured stripes that Sottsass claimed were inspired by the clothes he saw on the young girls on London's King's Road. Another important design was a small typewriter for Olivetti, portable and finished in bright red. It was a fashion accessory of its period comparable to the personal stereo of the 1980s and the 1990s laptop computer.

In 1972 the work of these Italian designers was given an international spotlight in New York with a Museum of Modern Art show called *Italy: The New Domestic Landscape*. It established the reputation of Sottsass and his contemporaries as designers with a high international status. But, ironically, even as the exhibition opened, Italy and the rest of Europe faced a severe economic recession culminating in the oil crisis of 1973. Quite simply it burst the bubble of energy and opportunity for experimental work. Many Italian designers now faced difficult years of survival and a number of the famous 1960s studios went out of business. Sottsass reverted to his personal research and his long established contacts with mainstream Italian industry. He had always explored work which might legitimately be placed in the artworld and he continued these experiments. Like so many of his generation he was attracted by alternative religions and developed an interest in Eastern philosophy, visiting India as early as 1961. These interests outside the world of design were explored in the 1970s. In 1976, for example, the Cooper-Hewitt Museum in New York exhibited a show of his photographs of desert landscapes which expressed his reflections on interiors and architecture. The same year his work represented Italy at the Venice Biennale. These projects saw Sottsass through a period of recession and conservatism with which his approach was rather at odds. But in 1980, at last, the cultural and economic climate was showing signs of change. He founded Sottsass Associates and then in 1981 set up the Memphis group.

By then in his sixties, Sottsass was very much the father figure to a group of international designers invited to produce pieces for the group. They opened a shop in Milan and together their work created a sensation in the world of design. For Sottsass it was an opportunity to re-examine his own design archive of work, the experimental pieces of the 1960s, his sculptures and installations. All these elements found a new expression with Memphis. He also quoted extensively the language of design history that he knew and loved from the 1950s. These quotations were expressed in pieces of confidence and maturity and included Sottsass's youthful spirit, sense of fun, love of irony and playful rejection of authority. This work turned Sottsass, more than any other designer, into a design hero of the 1980s. His age and authority and the sheer power of his creativity made him a guru whose opinions and ideas were massively influential. Although now nearly 80, Sottsass shows no sign of slowing down. He continues to work, lecture and design from his studio and home in Milan.

Biography

Born in Innsbruck, Austria, 14 September 1917, the son of the architect Ettore Sottsass. Family moved to Turin, 1928. Educated in Trento and Turin until 1934; studied architecture at the Politecnico, Turin, 1935–39. Served in the Italian army in Montenegro and Sargiacato, 1942–45. Married Fernanda Pivano, 1949; lived with Eulalia Grau, 1970–75; lived with Barbara Radice from 1976. Freelance writer, associated with the designer Luigi Spazzapan, in Turin, 1937–40, and with Giuseppe Pagano's group of architects, Turin, 1945. Architect and designer in Milan, from 1945; worked in the studio of the designer George Nelson, New York, 1956; employed as a design consultant by the Olivetti company, Turin,

from 1958. Designed furniture and lighting from the late 1940s; designed computers, machines, typewriters and systems furniture from the late 1950s; Indian-inspired ceramics produced in the mid-1960s; first architectural project completed in 1990. Founder-member of the Global Tools group, Milan, 1975, and of the Studio Alchimia design group with Alessandro Mendini and others, 1979 (resigned 1981). Founded Sottsass Associati architectural design partnership, Milan, 1980, and Memphis design group, Milan, 1981 (business ceased 1988), and publicity agency Italiana di Comunicazione, 1986. Received numerous awards including the Compasso d'Oro, Milan, 1959. Honorary Doctorate, Royal College of Art, London, 1968.

Selected Works

Examples of Sottsass's furnishings are in the Victoria and Albert Museum, London, the Museum of Modern Art, New York, and the Philadelphia Museum of Art. A list of his buildings and architectural projects appears in Emanuel 1994.

Sottsass's designs for Olivetti have included the *Elea 9003* computer series (1959), the *Praxis* (1963) and *Tekne 3* (1964) typewriters, the *Valentine* portable typewriter (1969), the *Synthesis 45* office furniture system (1971–73), and the *Icarus* office furniture range (1982). His designs for Poltronova have included the *Lucrezia* bench (1964–65), the *Asteroid* lamp (1968), the *Nefertiti* desk (1968), and the *Grey* furniture range (1970). His Memphis furniture has included the *Casablanca* and *Beverley* cabinets and *Carlton* and *Survetta* bookcases (1981), the *City* and *Park Lane* tables (1983), the *Hyatt* and *Mimosa* side tables (1984), the *Freemont* and *Tartar* consoles and *Ivory* table (1985), the *Max* bookcase and *Donald* table (1987). He also designed lighting, ceramics, textiles and glassware for Memphis between 1981 and 1985. Since winding up Memphis in 1988, Sottsass has designed furniture for Zanotta, lighting for Artemide, metalware and ceramics for Swid Powell, and hardware fittings for Fusital.

Spain

In Spain, as in the rest of Europe, the crisis that provoked the fall of the Roman Empire led to a decline in the techniques used in construction and wood carving, as well as causing more sophisticated types of furniture to disappear and be replaced by simpler, multi-functional pieces. Chests, beds, chairs and tables henceforth made up the household furniture that today seems modest but which should be evaluated within the context of the decoration used in medieval interiors. Textiles, which fetched far higher prices than other furnishings, would have been spread over the furniture and across the walls and floors. From very early times, Spain made far greater use of decorative tapestries than the rest of Europe because of the proximity of the Peninsula to its Muslim Kingdoms, which produced richly woven curtains and carpets, as well as importing them from the orient. The Christian nations initially imported and later imitated the products of the Cordoban *tiraces* (textile workshops). As late as 1254 the luxury of Eleanor of Castille's wedding entourage caused astonishment in London when she married Edward I; the streets through which the wedding procession passed were decorated with a vast number of hangings and tapestries.

Spain's relationship with Islam also affected other aspects of the nation's furnishings; it was strongly influenced by the orient from the 9th and 10th centuries onwards. This influence gradually ebbed as the image of the superiority of Muslim culture was steadily undermined by the Christian conquest of the southern territories. The settle and the dais are the most characteristic legacies of the relationship with the South. These are copies of the household furnishings adopted by the Omeyyads and Abbasids in the occupied territories, inspired by Greco-Roman and Persian traditions, and consisting of low, comfortable pieces of furniture. The settle was a luxurious divan derived from the Muslim *sarir* (a long throne-chair which was generally supported on legs or a stand but which sometimes consisted only of a mattress on cushions), which survived only until the 13th century. The dais became one of the most characteristic groupings in the history of Spanish interior decoration. It was comprised of carpets or tapestries spread over a low wooden platform or directly across the floor, on top of which were spread cushions and small mattresses of various forms. Individuals would sit cross-legged or recline on this base. From the 10th century, when documents testifying to its existence first appeared, the dais is known in drawing rooms for both women and men, as well as serving as a setting for

public ceremonies in Muslim life. Under the Catholic kings, it became an intimate piece restricted to women, located in the bedroom or close to it. Henceforth and until the 18th century, the dais maintained these principal characteristics, and women continued to recline on cushions even in public ceremonies.

The early history of Spanish furniture is based on a Roman substratum with which the Eastern imports already mentioned were gradually combined, together with influences from the Western Christian world, which gained ground as everyday life and Muslim rituals in Europe became richer, developing and gaining in prestige. Furniture during the High Middle Ages was constructed, as in the rest of Europe, with horizontal and vertical pieces of wood held together with thick pegs and with large panels nailed to each other or joined together to form an outer armature that acted as reinforcement. Decorations consisted of simple wood turnings and, from the 11th century, of European-style *arquillos*, as can be seen in the Tahull Bench, dating from the 12th century. Also worthy of individual mention is the complex "spool" turning (a succession of small spool, bobbin or reel pieces each carved in a different manner) developed in certain areas of Castille through the influence of Al-Andalus, which reached its apogee in the 13th century. There is little variety in the types of furniture, which are limited to chests, beds with posts, folding tables, furniture for monastic cells and chairs made to denote social status: thrones based on Byzantine and Western models, bishop's thrones like the one conserved in Rhodes belonging to Isábena and closed benches that can be related to the Germanic tradition.

New developments arose in carpentry from the 13th century due to the Mudéjars (the name used to describe Muslims who remained in Spain after the Christian conquest), whose specializations included wood carving. Their decorated ceilings are well known, but they also produced *ataujerados* (a decorative technique consisting of the application of fine layers of wood nailed on to the framework of the furniture to create a geometrical design of overlapping pieces of wood) pieces, such as the great cupboard in the Cathedral of Leon, dating from the 13th century, and those in the Convent of Santa Clara of Toledo, dating from the 15th century and today dispersed among various museums in Madrid. The Mudéjar stamp lasted until the 17th century and even later in decorations that made use of geometric elements, of which the best known is the tracery work in which a motif is repeated *ad infinitum*, capable of covering any surface without the need to resort to hierarchical compositions.

From the mid-14th century, the relationship with European cultures became more tightly-knit, and technical and decorative innovations imposed themselves, often fusing with local techniques. As a result, regional differences gradually became more pronounced. The Kingdom of Aragon, with a particularly active centre in Barcelona, looked towards Italy. Its furniture, consisting of simply assembled pieces, had coloured decorations of geometric inlay work (mentioned in documents from the 14th century), paintings on stucco appliques and reverse carving in tracery work. The most characteristic pieces of furniture are wedding or dowry chests and Catalan decorated cupboards, with scenes painted on the inside of the lids of the chests and inside the cupboard doors, left open to display all the components of the piece, also profusely gilded. In the Kingdom of Castile, closely related to France and Burgundy,

Spain: Moorish decoration, Salón de Embajadores, Alcázar, Seville, 1427

more sober furniture was preferred, of solid construction held together using transoms and jambs wedged together with pegs, forming a square framework over which panels were attached, and joined together with tongue and groove in the Burgundian manner. At the end of the Middle Ages dovetail joints began to appear, spreading during the Renaissance. The decorations were carved, with tracery work and parchment motifs. The Kingdom of Granada specialized in “block” inlay or marquetry work with *lacierias* (a geometric design of stars and polygons endlessly repeated, traced around a central motif). This method of production, which can be seen in a group of high-backed chairs – like the one preserved in the Museum of Hispano-Moslem Art at the Alhambra, or in the complete series commissioned for the Cathedral of Toledo at the end of the 15th century – in chests and in some cupboards, such as the one belonging to the same Museum, continued after the Conquest and was one of the most characteristic throughout the 16th century.

During the first third of the 16th century, the Islamic and Gothic traditions continued to influence Spanish furnishings. During the previous one-and-a-half centuries, furniture types had become more varied: chairs with backs and arms had appeared, sideboards, cupboards, *arqui hancos* (long benches

with one or more drawers) and chests of all shapes and sizes. However, it was during this period that the most important innovation – the desk – occurred. This was in the form of a box with a front that opened by means of a folding lid which also served as a writing surface; the interior contained drawers and small doors. It is usually known as a *bargueno*, a term first used in the previous century. Its antecedents dated back to various pieces of furniture from the end of the 15th century, such as certain types of chests and coffer (cupboard chests, table chests, writing chests) to the fronts of which drawers and outer doors were added. The definitive solution, inspired by oriental desks brought to Spain via Italy, and reinterpreted in the Western manner, appeared in the Kingdom of Aragon. The prismatic structure is similar to that of a chest, with small drawers and doors at the front distributed in a notably horizontal manner, and with a double lid, on top and in front. They were decorated with applied carvings and *pinyonet* marquetry, also known as rice grain, which consisted of small pieces of bone inlaid in clumps in geometric designs (wheels, stars, chequers, etc). The Castilian examples date from a little later; they lack the upper lid, and are decorated with carvings.

The second third of the 16th century saw the flowering of the Renaissance. This emerged first in the form of a repertory

Spain: Library of the Escorial, Madrid, 1584

of decorative motifs (candelabra, grotesques, faces shown in profile known as "Emperor busts", etc.) which were superimposed on traditional typologies, and later, from the mid 16th century, took the form of architectural structures used to order the composition of pieces of furniture in the manner of classical façades. The best example is the archival cupboard in the Anteroom of the Chapter House of the Cathedral of Toledo, executed by Gregorio Pardo between 1549 and 1551. There are no appreciable variants in the decorative techniques with respect to the previous period, except that larger pieces were introduced in marquetry work, more suitable for the new ornamental compositions. The repertory of furniture continued without any great variation, although signs of new typologies began to appear, becoming more prominent under Philip II.

Throughout Europe, Philip II represented the paradigm of severity and rigour both in his political and religious actions and in the monastic austerity of his building and decorative commissions which culminated in the Palace of El Escorial. However, an objective examination of the domestic and palatial interiors constructed during his reign puts an end to such an impression. The last third of the 16th century testified to a growing tendency towards varied and ostentatious furnishings, leading to the production of an ever-increasing range of furni-

ture, inspired by European types, and to a growth in the importation of luxury items.

In interiors, the distribution of rooms became more regular, as did the placement of doors and windows within the rooms; the fireplace became the central focus in drawing rooms, emphasizing their symmetry; skirting boards composed of tiles in which Renaissance themes gradually replaced Muslim ones, gave structure to the walls. Pictures or tapestries were hung on whitewashed walls. Decorative panels were subordinated to the architectural structure, as is apparent in the Hall of Battles in the Escorial, covered by frescoes painted to resemble tapestries depicting battle scenes. The scarce pieces of furniture were placed close to the walls.

Italianate Mannerism inspired Court commissions, as the Court became the most important artistic centre of the Iberian Peninsula. A severe and monumental classicism was reflected in furniture, which was notably architectural, and was displayed by the greatest interior of the period, the Library of the Escorial. This room was drawn up in the 1580s by the King's architect, Juan de Herrera, and built by the Italian Giuseppe Flecha assisted by Spanish masters such as Martín de Gamboa, Juan Serrano, Pedro Mayor and Anton German. The Library already made use of walnut as well as woods imported

from India: *acaná*, mahogany, *terebinto*, etc. These exotic species of wood began to be incorporated into high-quality pieces of furniture from this date, giving rise to a process of specialization leading to the emergence of the *ebanista* or cabinet-maker. Documentation already mentions "ebony joiners".

Medieval traditions in furniture making were now replaced by new typologies. The enclosing panels on chairs were dropped in favour of open forms: the armchair, derived from the Italian *seggione*, was characterized by a front row made up of interlacing bands, arms that ended in scrolls, and a cloth or leather seat and back (without stuffing) that was fixed to the armature with studs. In the richest inventories, reference is made to "resting chairs" and chairs in which to "take a siesta", similar to the ones previously described, as well as to *alcochadas* or padded chairs, like the "drop chair" belonging to Philip II, described and drawn by Jehan de l'Hermite in *Le passetemps*. Collapsible tables were substituted by the desk form, of Flemish origin, resting on stable supports joined together by crossbars and, frequently, also by wooden or metal *fiadores* or crosspieces. Some of these pieces served as dressing tables and include drawers for make-up. Beds with columns and half-columns, in the Italian manner, were also a novelty. Desks were made in the European style, with vertical side columns made of drawers and a central architectural door. In provincial circles, the horizontal method of articulation, established in the first third of the century, persisted for over 200 years.

Furniture was imported from the geographical regions most associated with the Empire: desks and tables with marquetry images and of mahogany and silver were brought from Austria; from Naples came mahogany pieces and engraved marble plaques; diverse Japanese lacquer items came via the Philippines.

The emergence of the Baroque style coincided with a crisis in the Empire and with growing economic problems. Spain oscillated between a disproportionate desire for luxury that sometimes led to a squandering of precious woods and metals, and an internal poverty that necessitated, among other things, the use of showy rather than precious materials. The copious importation of European products co-existed with a return to decorative traditions that were believed to be entirely Spanish, in an attempt to assert a sense of nationalism in the face of foreign enemies. For example, the brazier became more important than the fireplace, which lost the significance it had held during the previous century. The dais also became a vital feature in every house that had an acceptable standard of living, and its decorations became more profuse: it was covered with cushions, *guadamecies* (embossed, painted and gilded leatherwork) or cork, and it was furnished with the familiar cushions, small desks resting on small sideboards, candlesticks, small beds used as day beds, low seats, screens and display cases for expensive ornaments. Because of its unusual character, the dais was imitated in other countries: in Louis XIV's France, duchesses were given cushions to sit on in the presence of the king; in England in the 17th century the squat stool appeared as a support for the large pillows on which women sat. Furnishings in bedrooms became more profuse: long files of chairs were arranged along the walls, alternating with tables

Spain: chair, 17th century

or with *pies cerrados* (low cupboards with doors and drawers), on which desks and various ornaments were placed.

The reign (1621–65) of Philip IV witnessed the flourishing of the High Baroque, especially at the Court, where a decline in the prestige of the apparatus of monarchy was counterbalanced by an increased emphasis upon the pomp surrounding the Royal Majesty. Furnishings of the highest quality were decorated with veneers of dark woods (mahogany, *palosanto*) and with tortoiseshell or turtleshell, contrasting with applied *ormolu* and with sheets of marble or bone. The structural outlines remained relatively severe, and were brought to life with mouldings, carving and complex turning. The most important interiors of this period were those in the Buen Retiro Palace and of the former Alcázar, both in Madrid and both of which displayed luxury on a scale hitherto unseen. Unfortunately these interiors are now known only through written documentation, but a painting by Carreno gives a sense of what they must have looked like. Carreno's picture shows the Hall of Mirrors in the Alcázar which was furnished by Velasquez, the Principal *Posentador*, with hardstone tables resting on lions made of Italian bronze cast by Mateo Benicello in 1651, porphyry urns and mahogany and bronze mirrors. The influence of the Roman Baroque, which served as a model for aristocratic decorative interiors in which sumptuousness and pomp prevailed, is clear. Other places as well as Italy

Spain: small column desk *de columnillas*, 17th–18th centuries

inspired Spain's Golden Century. Furniture, especially desks and tables, lacquered with shell and mahogany was imported from the Low Countries (Antwerp) and copied in the Peninsula. Portuguese furniture, consisting of mahogany, *palosanto* and bronze desks, tables and beds, decorated with turnings, *tremidos* (curved mouldings) and *berjuelas* (carved ornamental tops), as well as of chairs made of carved black leather and desks from overseas colonies, also proved popular. More modest furniture alternated between severely decorated pieces in which more precious materials such as marble and mahogany were replaced by bone and stained wood, and items in which wood and gilded metals abounded. And during the last third of the 17th century carving was more widespread and the outlines of furniture became livelier, following the developments of the late Baroque.

The range of furniture expanded beyond the types introduced at the end of the Renaissance. The desk continued to be the decorative piece of furniture *par excellence* but lost its front lid, and greater emphasis was placed on the central door, which became increasingly sculptural. In the last third of the century, the foot and drawer of the *harguenos* became matching, while the frontal supports of desks were multiplied, like European cabinets. The most highly valued desks had tops decorated in porphyry, agate, marble or hardstone. The supports of wooden desks tended to be turned or were curved in the shape of a lyre,

like the metal *fiadores* or crosspieces that were given *eseados* profiles. Display cases, which spread during the reign of Philip III, were windows in which decorative or devotional objects were exhibited. Armchairs continued to be almost identical to their predecessors. As in the rest of Europe, greater attention was paid to comfort, with the emergence of the easy chair with stuffed arm rests, and back and seat upholstered in leather. Large pyramidal bedheads were developed, containing profuse *arquillos* and much turning.

With the accession of the Bourbon monarchy in 1700, Spanish interiors underwent radical changes. This was due not only to the French influence but also to the ruling family's close connections with Italy. The *cuartos* (a suite of rooms allocated to each member of the royal family) or rooms in the Alcázar and newly built palaces were henceforth arranged *enfilade*, and consisted of antechambers, chambers, libraries and bedrooms, following the French model popularized by Louis XIV. The interior decoration adhered to the rules imposed by architects and decorators, subjecting all details and objects to a general plan. This method replaced the traditional Spanish system of decoration that had been maintained until the reign of Charles IV and which relied upon the horizontal stratification of the internal architecture. Spanish rooms contained a low frieze or wainscot in proportion with the furniture, walls that barely divided up spaces and on which textile hangings have frequently survived, and ceilings painted with allegories glorifying the monarchy.

In 1711 Philip V (reigned 1700–46) began some modest alterations in the Alcázar of Madrid. These were carried out by Robert de Cotte and Carlier, who introduced a style that was still dependent on Louis XIV, with carved mural panels and mirrored fireplaces being the most outstanding innovation. The furnishings that came with the heritage of the *Gran Delfin* were not imitated in the Court, which maintained its links with Spanish tradition for several years. From the 1720s, several new types of furniture were slowly adopted, such as the sofa and *sillas a la francesa* or French-style chaise longue and, above all, the console table which, like other contemporary designs, followed the latest models from the Italian Baroque. The Palace of La Granja is a good example of the change in taste. It was begun in 1721 and a series of 40 console tables designed by Juvarrá were purchased for its interiors in 1739; these were used as models for later Spanish console tables.

In the mid 18th century, the Court accepted the Rococo style, oscillating between the influence of France during the reign of Ferdinand VI (1746–59) and of Italy, which gained in authority under his brother Charles III (1759–88), who had previously been King of Naples. The latter decorated the new Royal Palace, which replaced the former Alcázar, destroyed in the fire of 1734. He chose mural coverings of porcelain, fine woods (French-style *boiseries*), embroidered textiles and stucco, which co-existed with less innovative systems of hangings and frescoes. Charles III also created the Royal Workshops, imitating the French Gobelins Workshops; these included a Cabinet-Making Workshop. Here, Italian and Flemish master craftsmen predominated over the Spanish, who were only able to occupy the best positions in the second generation.

The repertory of furniture changed radically throughout the century, although without achieving the great variety of types

Spain: Gabinete de la Porcelana, Palace at Aranjuez, Madrid, 1760–65

that existed in France or England. The console table or the fireplace surmounted by a mirror or pier-glass and flanked by *torchères* or candlesticks formed an ensemble that was decorative as well as practical, providing light and warmth for the room. The dais gave way to an interior furnished with one or two sofas, armchairs and numerous chairs that were either of Queen Anne or cabriolet style, chaises longues and duchess chairs, as well as decorative desks or chests of drawers, nesting tables, screens, etc. Folding French-style dining tables, which were folded and put away after use, appeared in the 1730s, giving way to the dining room suite at the end of the century. The library was arranged with closed bookshelves in the Spanish style, with wire meshing, and with 18th century-style desks, such as the French-style writing table (*bureau plat*), or the drum desk. In the bedroom, the dressing table adapted shapes similar to ladies' writing desks, and the night table appeared next to the bed.

Away from the Court, the provincial centres assimilated French and English influences to varying degrees with the

Rococo style achieving the widest and most lasting acceptance. Catalonia had a solid craft tradition that enabled it to specialize in practical, well-constructed pieces of furniture, revealing the influence of southern France and northern Italy (Lombardy, Piedmont and Venice, and later Turin) in polychromatic and inlaid pieces of furniture. The most characteristic types of furniture denoted a bourgeois society: chests of drawers and large cupboards placed in the bedroom, beds with polychromed bedheads, dressing tables, high desks with two tiers, etc. Majorca and the Levant coast displayed tendencies similar to Catalonia. Andalucía united the sculptural qualities and undulating profiles of the Baroque tradition with the language of the Rococo, producing pieces of furniture made of modest woods, painted in lively colours and gilded. The North continued to display its preference for local woods in their natural colour, carved with pebble motifs. English furniture was imported in large quantities, especially lacquerwork items, via the ports of Cadiz, Gibraltar, Majorca and Minorca. English seats were imitated throughout nearly all of the

Spain: Saleta de Gasparini, Palacio Real, Madrid, late 18th century

Peninsula, and English details appeared in other pieces of furniture, such as cabriolet legs, ball and claw or hoof feet, etc.

The rediscovery of Classical Antiquity started before the death of Charles III, who had authorized the excavations of Pompeii when he reigned in Naples. His son Charles IV undertook a systematic programme of construction and decoration that included small palaces or pavilions at El Pardo, El Escorial and Aranjuez, and that inclined decisively towards French Neo-Classicism. He was an insatiable collector and lover of cabinet-making – he himself was a keen wood turner – and he acquired numerous pieces of furniture through his agents in Paris as well as sumptuous objects from other sources: Wedgwood porcelain, Adam-style lamps, Parisian clocks, etc. The Etruscan Style manifested itself in straight lines and antiquarian decoration that mixed the decorative repertory of Attic ceramics, Roman and Renaissance grotesques, and Louis XVI motifs. The years prior to the Wars of Independence (1808–14) witnessed the partial penetration of Directoire and Empire styles. The latter took hold after the expulsion of the Napoleonic troops in a version that was not as rich as the French style, but just as severe. Mahogany and other dark woods were imposed, decorated with metal applications in which bronze rarely appeared, and brass even less, and with gilded carvings, as can be seen in French-style beds (boat beds

and Turkish beds), candle holders, centre-piece tables, *klismos* chairs of Greco-Roman derivation, dressing tables with hinged mirrors, etc. Gradually, towards the 1830s, the rigorous lines were softened by straight or fan-shaped mouldings of a softer appearance, stylized floral marquetry work in light woods (holly, maple) and rounded volumes. The first signs of historicism appeared with the emergence of superficial Gothic profiles and a few pieces of furniture in the oriental style. The after-effects of Neo-Classicism continued until the mid-century.

The rise of nationalism and the need for specialization within the range of luxury furniture led European countries to revive the styles of their respective pasts. From the 1850s, Spain turned to its own heritage, but the prestige of the Second Empire in France and, to a lesser extent, the standing of the British monarchy during the Victorian period, led to a strong dependency on the creations of these countries. Elizabeth II of Spain chose furnishings from the firms of Bellange, Fourdinois and Jeanselme; lacquer and papier-mâché furniture with coloured flowers and mother-of-pearl inlays filled the salons, as did re-creations of the Louis styles. Heavily carved versions of the latter were produced, which related to national traditions of sculpture. Black lacquered furniture with gilded Chinoiserie was imported from the Spanish colony of the

Spain: dining room, Casa Batlló, Barcelona, by Antoni Gaudí, 1904–06

Philippines. Quilts and curtains, often incorporating complex, asymmetrical drapery arrangements became fashionable. Twelfth-century styles were reinterpreted and an erudite Gothic and neo-Arabian style straddled oriental fantasies and Hispano-Muslim Medievalism. Many craftsmen in Barcelona, a city that specialized in cabinet-making, imitated the Boulle technique and the city was favoured with the founding of the Royal Cabinet-making Factory, one of the first to use steam-powered machinery.

On the whole, however, the mechanization of the furniture and related industries in Spain occurred at a late date and was incomplete. Small quantities of machine tools were imported from England and Germany from the mid 19th century to supply some of the workshops in Barcelona and, subsequently, in Valencia, Madrid and a few other important cities. But it was not until the 1880s that mass-production was really viable, by which time the new techniques included mechanically produced plywood and inlays. Spanish factories produced furniture for the domestic and colonial markets; they were unable to compete with the European market, whose products were more highly valued. Furniture made of curved wood was manufactured in Valencia, with or without the Thonet patent, and Japanese-style bamboo pieces were produced particularly in Barcelona. The Spanish Renaissance style was added to the

other historical styles in vogue, and consisted of a mixture of Renaissance and Baroque elements and Henry II French-style decorations, leading to compact, bulky pieces of furniture that were all the rage until well into the 20th century.

Within the context of revivalist styles, Antoni Gaudí appears as an outstanding and original figure. His work was inspired by Catalan culture as well as being full of references to the local Gothic, which Gaudí used as a means of drawing upon the local craft tradition. From this basis, he developed an organic treatment of spaces and furnishings, underlining the expressive values of each, and with the aim of converting interiors into spaces for the dignified living of individuals. Gaudí designed his furniture using human forms, endowing it with anatomical qualities and an appearance of organic elements in full growth.

Catalan Modernism, which flourished at the turn of the century, was inspired by the work of Gaudí as well as displaying a strong French tendency, close to the School of Nancy, with the predominance of sinuous lines and arabesques. As usual, cabinet-making was outstanding, with Gaspar Homar being its most eloquent representative. During the second decade of the 20th century, forms became simplified as the work of van de Velde and the Viennese Secession became known, although these tendencies competed with the spirit of

nationalism which fomented decorative schemes inspired in popular and historical Catalan circles. Madrid was slightly at the margin of the latest developments, incorporating them only in a superficial manner.

During the 1920s Spain became more receptive to international tendencies and diverse styles were used according to the individual needs of each project or commission. An eloquent example of this trend is the furniture for the University City in Madrid, where Art Deco was used in official spaces, while the purely practical spaces (lecture halls, laboratories) had functional furniture, in some cases made of tubular steel and in others of traditional materials treated in a synthetic form. The Catalan bourgeoisie enthusiastically adopted Art Deco, which suited its cosmopolitan and discreetly innovative spirit.

The approach followed by the next generation was far more radical. Setting out from the need to rationalize the function of the home, furniture was designed that could be mass-produced using industrial materials. The promoters of this renovation were young architects who organized themselves in groups associated with the CIRPAC (International Committee for the Resolution of Problems in Contemporary Architecture) and with the CIAM (International Congress for Modern Architecture), becoming associated in 1930 under GATEPAC (Association of Spanish Architects and Technicians for the Progress of Contemporary Architecture). Joseph Maria Sert was their most outstanding representative, working in the studio of Le Corbusier, whose architectural projects embraced the concept of "total design" and included all the interior furniture. Sert's most famous work is in the United States, where he was exiled after the Spanish Civil War. However, before leaving Spain he had already undertaken important projects, the best-known being the Roca Jewellery House (Barcelona) and the Spanish Pavilion in the 1937 International Exhibition.

Modernization was abruptly halted in the aftermath of the Civil War and all avant-garde activities were suppressed. General Franco set up the Association of Guilds which included a cabinet-making workshop that hand produced high-quality historical items. This workshop aimed to be an example for Spanish workers not only in terms of the organization of labour, but also in the ideological and moralistic concepts that lay behind it.

Only in the 1950s did the idea of industrial design begin to interest a group of intellectuals such as Alexandre Cirici, who fought to establish it in what was a reactionary society and routine-bound industry. The Spanish Society for Industrial Design was founded in Madrid in 1955 and the Association of Industrial Design (ADIFAD) in Barcelona in 1960. The latter was accepted into the ICSID in 1961 and soon undertook a wide programme of activities among which were the Delta prizes for good design, aimed at promoting international debate in Spain and at establishing the bases for a developing profession. ADIFAD integrated the pioneers of design such as André Ricard and Oriol Bohigas, leading to the explosion of the 1980s.

Stained Glass

Stained glass was the pre-eminent public art form throughout the Middle Ages and is most strongly associated with the great cathedral or monastery church. Its use in a domestic and secular setting was rare by comparison; it remained a luxury product and its use was further constrained in decorative terms by the need to admit sufficient light to allow the conduct of the day to day activities of the secular interior. Nonetheless sophisticated and expensive schemes were commissioned for royal palaces, episcopal residences, public buildings and the houses of the aristocracy and mercantile upper classes. By the end of the 15th century and in the early years of the 16th century increasing numbers of domestic and secular environments were glazed with decorative stained glass. The Reformation and religious upheavals of the 16th century had a seriously disruptive effect on the production of stained glass, for the Church had been the glass-painter's most important patron. Nevertheless, although the demand for large-scale narrative schemes diminished, the demand for decorative and heraldic glazing continued to sustain stained-glass production into the 16th century and beyond.

During the Renaissance period stained glass provided an excellent opportunity for the public display of visual "propaganda", whether civil and political or personal and dynastic. In the hall of the great house this would most commonly take the form of heraldic glazing. The late 15th century glazing of Ockwells Manor in Buckinghamshire (c.1460), commissioned by Sir John Norreys is a well preserved combination of heraldry recording dynastic alliances, diagonal scrolls with mottoes and decorated diamond quarries. A similar scheme was commissioned by Archbishop Thomas Wolsey (c.1532-33) from the King's Glazier for the hall of Hampton Court Palace. This kind of glazing enjoyed a long vogue; the knightly family of Fawsley Hall (Northamptonshire) aimed for

a similar effect in their great hall in a period extending from the late 1530s to the 1570s.

The University, which attracted royal and aristocratic patronage, also provided the stained-glass artist with opportunities for secular employment. The glazing of the college chapel and the university hall would differ little from that of the great church and the great house, however, the library was an important additional location for extensive stained glass. In Oxford, Merton, Balliol and All Souls colleges all had glazed libraries, as did Jesus College in Cambridge. In the Jesus library, as in the library of St. Albans Abbey, the subjects of the windows related to the subjects of the books shelved nearby.

The great hall of an aristocratic house or palace was a place for communal entertaining and public display. The glazing of the private apartment was of a more modest and personal nature. The small stained-glass roundel – usually a single piece of white glass embellished with glass paint and yellow stain, the silver enamel in use from the early 14th century – provided a relatively inexpensive means of adding a figurative element to a simple quarry-glazed window. The quarries could themselves be painted with small-scale designs, monograms, foliage, humorous grotesques and fanciful creatures. Circular bullions could be used in preference to diamond quarries, although bullions would not normally be painted. Contemporary depictions of Netherlandish and German interiors indicate how roundels, armorials and small figurative panels were used; they were usually glazed into the upper third of a window, sometimes in combination with small heraldic panels, while the lower two thirds of the window were fitted with shutters rather than glass. The roundels used in these domestic settings frequently mixed secular and religious subject matter; the Labours of the Month and secular allegories such as the Netherlandish story of "Sorgheloos" (Careless), could be juxtaposed with images of saints held dear by the occupant of the residence, perhaps serving a private devotional purpose.

Contemplative panels of a more sophisticated nature were commissioned c.1502 by the patrician and scholarly provost of the Lorenzkirche in Nuremberg, Dr. Sixtus Tucher. Two trefoil panels of stained glass, now preserved in the Germanisches Museum in Nuremberg, depict Death mounted on horseback, shooting an arrow at an image of Dr. Tucher who stands before an open grave. This *memento mori* was probably made for the windows of the provost's study in his country house in the Grasergasse in Nuremberg and remained in the family's possession until 1833.

The most plentiful contemporary visual evidence for the appearance of the domestic interior relates to the high status (usually stone) dwellings of the rich. An insight into the glazing of the more modest town house of a wealthy citizen, probably that of Roger Wigston (d.1507), Lord Mayor of Leicester, is offered by 29 panels preserved from the wooden-framed windows of 18 Highcross Street, Leicester (now in Leicester Museum). The roundels were set into narrow lights, against painted quarries with decorative borders. Many late medieval and early Renaissance documents show that painted glass in town house settings such as this was often considered to be a movable fixture, to be removed and resited by their owners. This might account in part for their rarity, although their vulnerability in largely timber-framed and thus highly inflammable buildings cannot be overestimated.

Stained Glass: Swiss enamelled panel, mid-16th century

The secular glazing of the 15th and 16th centuries was normally permanently fixed into the window opening. Ventilation was provided either by the insertion of a lead ventilation grille, or by the simpler expedient of leaving the lower parts of the window unglazed – the opening of the shutters admitted both light and air.

By the end of the 16th century the nature of most secular stained glass had not greatly altered, although the techniques employed had changed. Early in the 16th century, however, a red vitreous enamel had been introduced and by the middle of the century blue, green and purple had been added to the palette of colours that could be applied to the surface of the glass. This freed the stained-glass artist from the laborious technique of cutting and leading together fragments of coloured glass in the traditional manner. Enamel pigments were invaluable in achieving some of the small devices required by the increasingly intricate quartered coats of arms demanded by secular patrons. The lack of opacity in enamel colours, a shortcoming in their use for monumental windows, was not too great a disadvantage in the kind of glazing that was designed to be seen at close quarters. Having first been used for armorial work, enamels began to be used to enliven other small figurative panels.

Little 17th-century secular glass-painting survives in England. In the years before the Civil War monumental stained glass enjoyed something of a revival under the influence of Archbishop Laud, attracting glass painters from continental Europe who also benefited from secular and domestic commissions. Abraham van Linge's quarry glazing of c.1629 at the St. John's house of Lydiard Tregoze (Wiltshire), executed in enamels, displays a diverse decorative repertoire which includes animals, birds, flowers, and fruit, all derived from Continental print sources. The enamel decorated quarries from Betley Hall (Staffordshire) of c.1621 are more medieval in concept and in their depiction of "A Mery May" are more traditional in subject matter. The outbreak of civil war and the triumph of the puritan Commonwealth ended this brief revival and only after the restoration of Charles II in 1660 did the demand for stained glass reassert itself. The city of York, one of the principal medieval stained glass centres, was especially significant in this period. The glass painter Henry Gyles (1645–1709) of York produced a number of impressive monumental church windows, but also worked on armorial subjects for the city fathers in the Merchant Taylor's Hall (1679–c.1702), Guildhall (1684), for the library of Trinity College, Cambridge (1704) and for a number of private houses. The sundial in stained glass was a popular phenomenon of the 17th and 18th centuries, a combination of art and science, to which Gyles contributed (e.g., Tong Hall, Bradford). Gyles's decorative sources were frequently Continental in origin.

In the Low Countries enamels were applied to roundels to create multi-coloured versions of what was already a highly sophisticated art form. Images of middle-class interiors of the 17th century reveal the widespread use of round and oval panels set into hinged casement windows with elaborate leaded light designs. The simple quarry or bullion background made way for increasingly decorative leading patterns. The glazing fills the full height of the window opening mounted in a wooden or metal frame that opened inwards to allow ventila-

tion. In the most elaborate windows the roundels are surrounded by panes of glass painted with Renaissance and Classical architectural motifs, cartouches, swags of foliage, putti, grotesques and genre details, executed with delicacy and in colours light enough to admit plenty of light. Few of these elaborate windows now survive *in situ* in either Belgium or the Netherlands, having fallen victim to iconoclasm and neglect. They were however, very popular with 19th-century antiquarian collectors, and a number are now preserved in museum collections. The Metropolitan Museum in New York holds two panels dated 1618 thought to have been made in Haarlem after designs by Marten van Heemskerck, depicting the Corporal Acts of Mercy, a subject popular with wealthy townsmen for whom Christ's example provided a charitable model. A second pair of panels, dated 1620, perhaps from Alkmaar, depict allegorical scenes, classical ornament and the arms of Geertien Matthys de Ens and his wife, Veronica Johans de Hubert, and are very similar to a panel of 1638 in the Victoria and Albert Museum with the arms of Johannes Jansen, probably a physician or apothecary. A painting of c.1660 in the Wallace Collection in London by Pieter de Hooch (1629–c.1684) who lived and worked in Haarlem, Delft and Amsterdam, depicts a substantial urban interior with glazing remarkably similar to the stained-glass panels now in New York and London. The De Hooch painting shows gauzy curtains used to obscure the lower parts of the windows, but shutters continued in use for privacy and insulation at night, and when not in use could be folded right back, allowing the stained glass to be appreciated in a way that was impossible with most types of curtain or drape.

Nowhere were enamels put to better use than in the products of the Swiss stained-glass artists of the 16th and 17th centuries. The habit of commissioning roundels, heraldic and commemorative panels to celebrate wedding alliances, personal and political affiliations, taxed the technical ingenuity of the Swiss glaziers, who became masters in the use of enamel glass painting techniques. Swiss panels contain a profusion of secular and domestic detail, reflecting the prosaic interests of their owners. Contemporary images of Swiss interiors of the period indicate a preference for bullion settings in which the coloured panels were set at the top of the window, allowing plenty of light into the room. They are a manifestation of the prosperity of urban life in the Swiss cantons and were destined for the houses of the middle classes, for inns and public buildings.

By the end of the 17th century, the use of glass in the windows of urban dwellings was relatively commonplace, having a significant impact on the texture of the architectural exterior and an influence on the perception of its interior. Changes in methods of manufacture enabled glass-houses to respond to the increased demand for window glass. Broad glass, a thinner type of muff glass, used extensively for plain glazing, and crown glass, made in increasing quantities from the mid-16th century onwards, could be made in larger and thinner sheets. Both were used for plain glazing and leaded lights and made domestic glazing more affordable. Stained glass, involving the use of coloured glass, glass paint or coloured enamels, remained expensive, however, and for many secular patrons decorative leaded light remained an acceptable alternative. Sources such as Walter Gidde's *Booke of Sundry*

Draughtes of 1615, intended as a source book for glaziers, plasterers and gardeners, offers a rich selection of geometric and interlacing designs in which glass and lead work together to create a richly patterned window. This type of glazing required considerable skill in the measuring and accurate cutting of glass, but may well have been the work of craftsmen who no longer handled the different processes of painting and firing stained or enamelled glass, which could be bought in the form of a single roundel or armorial when required for a more costly commission.

Stained glass in a hinged casement was vulnerable to damage and expensive to repair, and the thinner glass of the later 17th and 18th centuries was less suitable for stained glass. The development of the more convenient wooden sliding sash window by the mid-17th century and the increasing popularity of curtains from the late 17th century onwards, contributed to the declining popularity of traditional stained glass in the domestic interior. Increasing reliance on classically-derived architectural forms made coloured or painted glass less and less appropriate. The 18th-century interior was most commonly characterized by large windows with wooden framed glazing bars into which large pieces of plain glass were set, admitting plenty of daylight, an effect that could be maximised by the use of numerous large mirrors on the intervening walls. In certain circumstances, however, the demands of privacy made the obscuring of a window desirable. "Jealous" glass, an early kind of cast glass, was introduced to the lower parts of street windows for the sake of privacy. In the more elegant setting of the town house, engraved, etched or coloured glass could be used in the fanlight or side lights of a door for the same reasons. More elaborate decorative techniques, involving glass beads and metal filaments were also employed.

Stained glass could not be said to be one of the major arts of the 18th century, either in the monumental setting of the church, or the smaller scale intimacy of the domestic interior. Recent research has revealed, however, that neither was it a period of complete decline and stagnation. In the second half of the century in particular, there was a continued appreciation of the charms of the small-scale decorative panel, to be studied and enjoyed at close quarters. Margaret Pearson (d.1823), wife of Dublin-born glass painter James Pearson (d.1805), for example, specialised in exquisite flower paintings and copies of popular paintings of the day, such as her luminous copy of Joseph Wright of Derby's *Blacksmith's Shop* executed on glass at Burghley House in Lincolnshire. This modest revival of interest in stained glass was given impetus by its identification as a valuable element in the creation of the romantic neo-Gothic interior, although experimentation with oil-painted transparencies pasted onto windows, and blinds painted in imitation of glass painting existed alongside the use of real stained glass.

From the middle of the 18th century onwards ancient stained glass began to be imported into England to cater for the tastes of the scholarly and antiquarian collector, and the impact of this collecting was to be greatest in the context of the domestic interior. One of the most famous collections was that of Horace Walpole at Strawberry Hill who began collecting glass in the 1750s. His eclectic collection of roundels, armorials and small figurative panels, many of them not medieval at

all, were introduced into the windows of the great parlour, the library and armoury, with smaller selections in the corridor windows and set into a staircase lantern. The glass was an important aspect of the decor, contributing to the creation of a playful Gothic fantasy interior. William Beckford's eccentric Fonthill Abbey combined ancient stained glass (a superb Renaissance panel from Ecouen now in the Victoria and Albert Museum, was purchased in 1814) with stained glass commissioned from the most able craftsmen of the day, James Pearson, Francis Eginton and his son William Raphael, who had also worked for the Duke of Norfolk at Arundel. William's biggest window was for the library at Stourhead.

Antiquarian collections of glass were also assembled at Costessey Hall in Norfolk and at Dagenham Park in Essex. Enormous quantities of stained glass became available to collectors as a result of the French Revolution and the Revolutionary wars, during which many churches and monasteries throughout France and beyond her borders were secularized and their treasures dispersed to the highest bidder. Late 18th- and early 19th-century travellers could acquire stained glass and other ecclesiastical furnishings very cheaply. Enterprising men like John Christopher Hampp of Norwich travelled to Europe to collect stained glass for sale at home. In 1804 Mr. Christie held a large sale of stained glass in his sale room in Pall Mall, London. The catalogue suggested that figurative roundels and armorials were the most numerous items offered for sale. The mania for collecting was not confined to English antiquarians, however; in his house at Weimar, Goethe included panels of medieval glass among his many thousands of treasures.

Francis Eginton (1737-1805), who had been employed by Walpole at Strawberry Hill, had originally worked for Matthew Boulton's famous Soho ceramic factory in Birmingham, but moved into stained glass in 1784. His career serves as a reminder that the expertise of ceramic manufacturers was an important factor in the development of stained glass in the late 18th century and early 19th centuries, especially in Europe. A number of French paintings on glass survive from the late 18th century, similar to those executed by Eginton for Margaret Pearson. Of greatest significance are those associated with the two workshops sponsored by the great *porcelainiers* of Sèvres and Choisy-le-Roi. The chemist Alexandre Brongniart had been experimenting with glass painting since the earliest years of the 19th century and in 1828 established a stained-glass workshop that enjoyed the patronage of King Louis-Philippe, who commissioned windows for the chapel of the royal palace of Dreux. The workshop employed artists like Ingres and Delacroix for some of their most prestigious commissions, but also produced numerous "conversation pieces" with subjects ranging from military scenes and portraits of soldiers, still life landscapes and copies of famous paintings. The workshop was active until 1854.

Royal patronage was also significant in the stained glass revival in Germany in the late 18th and early 19th century. In Munich King Ludwig I encouraged the establishment of the Königliche Glasmalereianstalt and it is no accident that in addition to full-scale windows for churches, the manufacturers made glass copies in vitreous enamels of late medieval and early Renaissance pictures, a reflection of the collecting interests of the king, the founder of the Munich Alte Pinakothek.

Stained Glass: window in the drawing room, Linley Sambourne House, London, c.1868

Activity was not confined to Munich, and high-quality enamel work thrived in other cities well into the 19th century. In Stuttgart, for example, the glass-painter Carl Johann Baptist Wentzel made a series of 20 exquisite enamel-painted panels with classical subjects for Wilhelma, the villa of King Wilhelm I of Württemberg.

Although the collecting of old glass may have been confined to a relatively small circle of men with antiquarian tastes, their influence was considerable. Thousands of people visited Strawberry Hill, for example, and in the 1820s the architect John Soane introduced stained glass into the rooms of his own house in Lincoln's Inn Fields, London, where his extensive collections were displayed. Importantly, the contemporary stained-glass artists called upon to install these ancient treasures gained valuable experience in the materials and techniques of an earlier age, providing a valuable background for the more thorough-going archaeological Gothic Revival of the 19th century.

The 19th century was the period in which stained glass recovered the status afforded it in the Middle Ages. Nowhere was this more so than in England, which for much of the 19th century was to set the artistic and technical standards that were admired internationally, and enormous amounts of British stained glass were exported throughout the world. The revival

of Gothic architectural styles was accompanied by a realization that it was the nature of the glass-painter's materials and techniques as much as the style of the painting itself that separated it from the achievements of the Middle Ages. British experimentation with pictorial styles and enamel techniques was relatively short-lived, and during the first half of the century the "true principles" of the craft were recovered and successful experimentation in the manufacture of "antique" glasses made available materials that approximated in their character and quality the glass of the Middle Ages.

The Gothic Revival in stained glass was principally an ecclesiastical phenomenon and the building of thousands of churches in a variety of medieval styles provided stained glass workshops with a constant flow of lucrative commissions. Nonetheless, the University colleges, private residences of the wealthy and public buildings such as town halls, public libraries and hospitals, also provided stained-glass artists with work.

The first half of the 19th century could be said to be the period in which stained glass designers worked in an "archaeological" idiom. The careful study of medieval glass, often in the course of restoration, resulted in designs for new windows that were credibly medieval in appearance. In the domestic and secular context this resulted in interiors with a strongly eccle-

siastical flavour. The architect and designer A.W.N. Pugin (1812–52), one of the most influential figures in the revival of stained glass in a traditional manner and medieval style, introduced stained glass into all his major buildings. At his own house, The Grange, in Ramsgate, Kent, stained glass was but one of a profusion of decorative elements conceived in medieval styles. The heraldic panels are set against diagonal scrolls bearing mottoes, in a conscious and accurate evocation of the glazing of a medieval baronial hall. At Davington Priory in Kent the stained glass designer, decorator and heraldic artist, Thomas Willement (1786–1871) included stained glass in the decoration and refurbishment of the medieval monastic buildings that he made his home. His firm made hundreds of stained-glass windows in a variety of medieval styles, many of them for churches, but many for secular and domestic interiors such as Alton Towers and Windsor Castle.

In the battle of the styles waged in the early decades of the 19th century, Gothic was to emerge as the victor, not just for the construction of new churches, but as the preferred style for many great public buildings. One of the earliest and most influential were the new Houses of Parliament, designed by Sir Charles Barry, but with the extensive and intimate involvement of Pugin in both architecture and decoration. All of the stained glass was designed by Pugin. That the Houses of Parliament, the seat of government for the Empire, were to be extensively and expensively glazed was to be of considerable importance in setting a standard for public buildings both nationally and internationally.

While Pugin and Willement looked to the medieval church and the great hall for the source of their inspiration, the artists of the Pre-Raphaelite Brotherhood and their younger admirers, Edward Burne-Jones and William Morris, were enamoured of the private chamber, the setting of the *roman de chevalier*, the environment of courtly love. In 1861 William Morris (1834–96) formed the decorating firm of Morris, Marshall, Faulkner & Co., intending to set about the reformation of the decorative arts in Britain. Their products reveal the kind of interior that appealed to them. The firm (after 1875 Morris & Co.) became the best-known decorators in Victorian Britain, offering a complete vision of the tasteful interior that embraced tiles, textiles, wallpapers, ceramics and, from the start, stained glass. The success of the firm owed a great deal to its promotion by a number of architects associated with a revival of interest in domestic architectural styles.

Although Morris designed a considerable amount of figurative stained glass, his greatest contribution to the success of the firm's stained glass was in the direction of the work as a whole. His influence was pervasive, for to him fell the choice of colours and the design of the backgrounds and decorative details that make the firm's windows so recognizably part of the luxuriant family of Morris products. In the first phase of the firm's history, Rossetti, Burne-Jones, Ford Madox Brown, Simeon Solomon and other members of Morris's circle of friends designed glass for the firm. After 1875 Burne-Jones emerged as the principal designer.

Morris & Co. church windows far outnumbered their windows for secular and domestic settings. Nonetheless it was enormously important that stained glass was conceived as a natural part of the integrated Morris interior. In 1866 the firm received the seal of approval from the South Kensington

Museum (now the Victoria and Albert), commissioned to carry out a scheme of decoration for the Museum's principal public refreshment room, the Green Dining Room, a scheme which included tiles and three two-light windows with female figures and quarry backgrounds. Through the personal contacts of Morris and Burne-Jones, the company was commissioned to decorate the homes of the wealthy and cultured Greek community in London. Through the influence of restoring architects like Bodley, the company was called in to work at the Oxford and Cambridge colleges, in chapels and domestic ranges, notably Christ Church and St. Edmund Hall in the former and Jesus and Peterhouse in the latter.

In much of their non-church work, Morris and his collaborators evolved a truly secular iconography for stained glass, revealing the romantic and intensely literary vision of the Middle Ages that inspired it. The Peterhouse Combination Room windows of 1869, for example, depict scenes from Chaucer's *Legend of Good Women*, while the later windows of 1871–74 depict figures from the college's past. The 1873 windows for the library at Cragside depict, appropriately, literary figures set against verdant backgrounds of typical Morris foliage. The five designs for scenes of King Rene's honeymoon (1862), now in the Victoria and Albert Museum, were originally conceived to decorate a cabinet designed by the architect J.P. Seddon, but were probably made in glass for display at the 1862 exhibition, at which the firm's glass was widely admired.

While other European countries experienced their own Gothic Revivals, America was slow to participate in this phenomenon, importing windows from a wide range of European manufacturers. In the last quarter of the 19th century, however, American designers Louis Comfort Tiffany (1848–1933) and John La Farge (1835–1910) popularised a specifically American stained-glass idiom, using a range of experimental glasses intended to minimise the amount of paint needed to create detail. These "art glasses" with their heavy texture, iridescent and opalescent effects were also used for tableware and, of course, for the famous Tiffany lamps. The glass, often plated in several layers, was held together by copper foil rather than the more traditional lead. Although both La Farge and Tiffany designed figurative windows and windows for ecclesiastical settings, some of their most successful windows were for the private homes of the wealthy, where their opulence and glowing colour complemented the rest of the decor. While some of the domestic commissions of both Tiffany and La Farge were figurative, the stairway window for the Webb Horton Mansion, Middletown, New York (Tiffany 1902) and the "Welcome" window for the house of Mrs. George T. Bliss on East 68th Street, New York City (La Farge 1900), for example, many of the most effective depicted landscapes, foliage and birds, offering the occupants of the houses a restful and idealised view from their windows. The pair of windows made by Tiffany in 1912 for Captain Joseph R. DeLamar's Pompeian room in his town house at Madison Avenue and 37th Street in New York exemplifies opalescent landscape windows at their best, with one window depicting cockatoos eating cherries, while the second shows a peacock against a wisteria-framed arch.

In the output of the Tiffany studio, domestic commissions rivalled church work in importance and value and the two firms evolved a genuinely American idiom. Indeed, the popu-

larity of Tiffany and La Farge windows generated what might almost be described as an opalescent revolution in America. Thousands of imitators filled churches and private houses with opalescent windows of very variable quality and artistic merit.

The development of a wide range of machine-made glasses in the later 19th century led to an explosion in the use of decorative glazing in the secular sphere. Shops, restaurants, commercial premises, all were provided with decorative glazing. Nor was stained glass confined to exterior windows; doors, screens and furniture were all designed to receive glazed panels, many in the sinuous vegetal forms of the Art Nouveau that was so popular in America and Continental Europe. The Art Nouveau glazing of Brussels, Nancy, Darmstadt, Milan, Barcelona and Chicago has more in common with leaded light than traditional stained glass, as much of it has little fired paint and relies heavily on the graphic line of the constructional lead. The figurative windows of Eugène Grasset in France and Glasgow artists E.A. Taylor and George Walton parallel the poster art of their day and in their secular subject matter and languid style were ideally suited to private houses, shops, restaurants and hotels. Architects and designers like Hector Guimard (Hôtel Mezzara, Paris 1910), Victor Horta in Brussels (van Eetvelde House, 1899 and his own house of 1898) and Domenech I Montaner in Barcelona (Palau de la Musica Catalana, c.1907) found ways to integrate decorative glass in large expanses into their architectural spaces, adding vast areas of light and colour.

Art Nouveau had less impact in England, although its debased heirs can still be seen in many between-the-wars suburban villas. In England, Arts and Crafts designers, who drew inspiration from traditional vernacular forms, despised the new style.

The stained-glass artists of the British and Irish Arts and Crafts Movements of the late 19th and early 20th centuries regarded themselves as the true heirs of William Morris and remained loyal to the tradition of high quality glass-painting and the use of "antique" hand-made glasses. The circle associated with stained-glass artist and teacher Christopher Whall (1849–1924) reinvigorated stained glass design in Britain, Ireland and even in America; the work of Charles Connick, for example, employed a strong painterly style, vigorous figure drawing and a rich palette of thick slab glass, set off by sparkling white glass. Although Whall's output was predominately for churches (he and his pupils benefited from the enormous demand for War Memorial windows after World War I), his commitment to quality of design and material was such that he published designs for leaded lights, intended to be made from the subtly tinted slab glasses available to British artists until comparatively recently. Such was the reputation of Arts and Crafts stained glass in Ireland that Dublin stained-glass artist Harry Clarke (1889–1931) was commissioned in 1926 to make the young Republic's gift to the International Labour Building of the League of Nations in Geneva. Depicting scenes from Irish literature, the Geneva window was not installed, being deemed too controversial and risqué (the window has now been acquired by the Wolfsonian Foundation in Miami).

For much of the 20th century stained glass has suffered both from its too-close association with the church and from the prominence of architectural styles that are, for the most part, unsuited to the incorporation of coloured windows. In

Germany much work of the first half of the century, together with much 19th century work, was destroyed in the two world wars, although what has survived has revealed its strength and vigour. Dutch-born artist Johan Thorn Prikker, for example, experimented in abstract forms and images derived from the Jazz Age, while his large figurative window of 1911 for Hagen railway station has an Expressionist quality that could be compared with the work of Dublin-trained artist Wilhelmina Geddes.

Bauhaus designers Theo van Doesburg and Josef Albers experimented with glass as a design medium and the Bauhaus included a stained glass studio, although its output was low. The American architect Frank Lloyd Wright used stained glass more extensively, designing clean, simple panels subtly integrated into the decor of his offices and houses. Stained glass was never, however, a predominant aspect of a Wright interior.

In the Postmodernist era stained glass fares better, with a renewed interest in the application of colour to architecture. German designers Ludwig Schaffrath and Johannes Shreiter have inspired a post-war generation in both Europe and America with their clinical lines, primary colours and their abandonment of painted detail. British designers Brian Clarke, Graham Jones and Alex Beleschenko have all worked on major secular and commercial architectural projects, demonstrating that stained glass has a continuing relevance in contemporary buildings. Airports, golf clubs, shopping malls and hospitals have all attracted stained-glass commissions. New geographic markets have emerged; the Middle East with its unremitting light levels, and Japan, with no indigenous stained glass heritage but with an insatiable taste for collecting historic stained glass and a growing number of native designers, both promise to add new chapters to the story. New materials and techniques developing out of industrial glazing techniques and the technology of the glass skyscraper offer artists exciting new opportunities for expression. At a more modest level, the taste for authentic decor that emerged in the course of the 1970s and 1980s has resulted in many commissions for Victorian and Edwardian style doors and windows, in many instances replacing original glass swept away in the 1950s and 1960s, and is helping to create a demand for stained glass in even quite modest homes. As the millennium approaches, stained glass in the secular setting is once again making its mark.

Staircases

The design and decoration of prestige staircases in European post-Renaissance architecture was a product of the secular, courtly cultures of early modern nation states. The rise and fall of the staircase as an artistic entity correlated with the sophistication and attenuation of notions of hierarchy and formality as these cultures developed and were then eroded, staircase decoration finding its greatest elaboration in mid 18th-century southern Germany and Austria.

Most principal staircases in even the grandest secular buildings of Renaissance Italy were neither spatially innovative nor decoratively particularly elaborate. A tunnel-vaulted dog-leg remained the norm, what Nikolaus Pevsner called “vaulted corridors running up at an angle”. As the flights of the staircase were housed in separate spaces, so architectural features were experienced sequentially. Decoration clarified this sequence by marking points of ingress and exit.

As the staircase was usually the main point of entry to a building, its first flight assumed an important role in ceremonies of arrival and departure, and this could be expressed by giving it greater elaboration. At the Cancelleria, Rome (1479–82) the lower flight is preceded by a podium emphasised by Doric pilasters and a cross-vault which form a permanent ceremonial baldachin. In the Palazzo Farnese, built by Antonio da Sangallo from c.1514, the entrance to the staircase is even grander. The decoration extends the whole of the short first flight, cleverly managing the change from the exterior scale of the courtyard to the smaller scale of the upper flights. The Doric capitals of the courtyard loggia swing up to form a cornice before settling as a capital again on the first landing, at the level of the loggia cornice (Chastel, 1985).

Examples where all the flights of a tunnel-vaulted staircase

were given a comprehensive decorative treatment were rare and found only in the most prestigious buildings, such as the Scala d'Oro in the Doge's Palace, Venice (Jacopo Sansovino 1556–60, executed by A. Vittoria and G.B. Franco) or, in France, the Escalier Henri II in the Louvre (c.1550).

Other areas of Europe maintained their own traditions. Despite the “Roman Staircase” at Burghley House, Lincolnshire, a barrel-vaulted exception showing French influence (Girouard, *Country Life*, 1992, pp.58–60), most impressive English staircases of this period were of wood rather than stone (Newman in Chastel 1985). At Knole, Kent (1605–08) a relatively small open-well staircase is made impressive by being crammed with ornament displaying classical detail and heraldry. The orders are used in correct sequence, with Tuscan columns supporting the ground floor arcade and Ionic on the first floor, though the Corinthian pilasters above this can only be squeezed in by making them rest incongruously on the Ionic capitals. The painted wall decoration was probably the work of Paul Isaacson, a member of the Painter Stainers Company. It is mostly in grisaille but coats of arms are picked out in the correct colours. More coats of arms are held by the Sackville leopards on the newel posts of the stair, which are repeated in *trompe-l'oeil* on the walls. Other important surviving Jacobean staircases, such as Hatfield House, Hertfordshire (1607–11) and Blickling Hall, Norfolk (begun 1619), would originally also have been brightly painted.

In southern Europe the 16th century saw the creation of grand stair-halls housed under a single vault. Conceived as an introduction of exterior architecture into the interior of a building – whether in terms of Michelangelo's applied order at the Laurentian Library in Florence (from 1524) or of Herrera's extreme severity at the Escorial (1571–73) – a tradition of purely architectural monumentality was established. The benefit of this non-decorative treatment was the contrast with the rich apartments to which the staircase led. This was the approach favoured in France, where notions of aesthetic decorum were most strictly followed. The only non-architectural detail allowed in the staircase of François Mansart's Château de Maisons (1642–46) is the high-relief frieze of playing putti by P. Buyster beneath the main entablature, their liveliness offsetting the iciness of cut stone. This formula, minus the all-important touch of life, was followed faithfully by 18th-century architects. If these spaces do not seem dead, it is often due to the wrought iron and bronze staircase balustrades brought to a pitch of perfection at this time. A fine example, made in 1733–41 for the Bibliothèque du Roi in Paris, probably to the designs of Robert de Cotte, is now in the Wallace Collection, London.

Nevertheless it was also France which invented, in Charles Le Brun's Escalier des Ambassadeurs at Versailles (completed 1678), the highly decorated palace staircase of the later Baroque. The innovation at Versailles was to combine monumentality with colour and decoration previously used only in smaller spaces. The stair, destroyed in the 18th century, was ablaze with coloured marble, while gilding smothered not only the bases, capitals and entablature of the Ionic order girdling its *piano nobile*, but also the doorways to the apartments and relief panels of trophies and coats of arms. White marble added to the effect in the fountain by Chevetot facing the visitor on the first landing, above which was the focal point of the ensemble.

Staircase at the Residenz, Würzburg, by Balthasar Neumann, 1720-44

ble, a bust of Louis XIV by Warin, later replaced by one by Coysevox.

The position of the staircase in the body of the château was a determining factor. The only way it could be lit was by a large (for this date unique) skylight, so a decorative scheme centred on a single-scene illusionistic ceiling painting was ruled out. Instead the vault area left for painting followed the architectural divisions of the walls below and, after Annibale Carracci's gallery in Palazzo Farnese, used a three-level mode of representation, enriching an architectural *quadratura* with figurative grisailles enclosed in plaques and with allegorical figures and animals apparently occupying the real space of the viewer. The illusionism was continued in four bays of the main storey, which were occupied by painted modern-dress representatives of the four continents watching the visitor ascend the staircase and paying their own homage to the king. This theme of the four continents, appropriate for greeting an ambassador and a key one for stair-halls, had its most complete exposition at Versailles.

The variety of materials and modes of representation used in the Escalier des Ambassadeurs was taken to heart in the Holy Roman Empire. Of all German Baroque palaces, the stair-hall of Schloss Augustusburg at Brühl near Cologne is the most dependent for its effect on decoration rather than on spatial values. The structure was designed in 1744–48 by Balthasar Neumann, but was decorated by others c.1761. The laurels go to the stuccadors led by Giuseppe Artari who executed the brilliant polychrome decoration incorporating applied figure sculpture and rocaillé panels, with trios of caryatids supporting the upper stair ramps and paired gods carrying a second floor gallery. The air of enchantment is emphasised by the subtle use of materials. As one goes up, marble gives way to stucco and then, in the ceiling, to fresco – in ascending orders of apparent dematerialisation (and also cheapness). As Pevsner commented on a comparable staircase, “The spatial rapture [is] in this decoration transformed into ornamental rapture”.

Neumann also designed the structure of the staircase at the Residenz at Würzburg, Bavaria. Despite the gorgeousness of Brühl, Würzburg must stand at the apex of staircase decoration. The vast vault gave Giambattista Tiepolo the opportunity to produce his greatest work (1752–53), a depiction of the four continents paying homage to Apollo as patron of the arts (Laing, 1978; Alpers, 1994).

The Würzburg stair had no British equal; Antonio Verrio's obscure painted allegory of 1702 covering the King's Staircase at Hampton Court (1702) is a poor cousin of Versailles. There was a distrust of such aggrandizement of patrons, as seen in Matthew Prior's comment that William III's military triumphs were to be seen everywhere except on the ceilings of his palaces. In any case, most Palladian country houses were entered on the *piano nobile* and had no need of a large interior staircase leading to the state rooms.

Where the British did excel was in elegance and practicality. Staircases cantilevered from the wall and visually apparently unsupported had been built in Renaissance Italy. An early English example in stone was in the Queen's House, Greenwich (Inigo Jones, 1633–40), but advances in joinery meant that similar structures could also be put up in wood, combining lightness with exquisite inlaid detail and turned and

Staircase at the De La Warr Pavilion, Bexhill-on-Sea, Sussex, by Serge Chermayeff and Erich Mendelsohn, 1934–35

carved balustrades. Fine examples are at Beningborough Hall, Yorkshire (William Thornton, 1716) and Claydon House, Buckinghamshire (1768–69).

Meanwhile cast iron posed a potential revolution in staircase design. Adventurous architects seized the opportunity for designing airy structures with filigree treads and risers, such as the stairs in the Royal Pavilion at Brighton (Nash, 1814) copied by Friedrich Schinkel at Prince Albrecht's Palace in Berlin (1830–33). The possibilities for mass-production meant that by 1800 speculative builders in London could use ready-made balustrades to designs by fashionable designers like Robert Adam or James Wyatt. Later whole staircases could be mass-produced, each tread, riser and side panel being separately cast for on-site assembly.

The tradition of display survived into the 19th century, enjoying a lavish swan song in Charles Garnier's Paris Opéra (1860–75). Its staircase was designed not for the use of the emperor but for the grand-bourgeois subscription-holders. It draws on the French Neo-Classical tradition, in particular Victor Louis's Grand Théâtre at Bordeaux (1772–80), but elaborates and animates academic forms with writhing figure sculpture, polychrome marble and gilded bronze. Garnier's aim was to recreate in three dimensions the architectural backdrops

of Veronese, and his decoration exceeds anything from the preceding centuries in its plastic complexity.

Gothic, too, could be used for impressive staircases in public buildings, as was shown by Alfred Waterhouse at Manchester Town Hall (1867) and G.G. Scott at the Midland Hotel, St. Pancras Station (1865–69). But the heart of the Gothic revival was necessarily ecclesiastical, and convincingly medieval staircases were more difficult to achieve in smaller, domestic settings. Despite the example of William Burges's polychromatic solution at Cardiff Castle (1872–84), not many Victorians thought a cramped spiral stair acceptable in a modern home. Given the tendency towards honesty of expression urged by A.W.N. Pugin and his followers, it is not surprising that most Arts and Crafts houses, such as Philip Webb's Red House, Bexleyheath (1859–64), have relatively modest open-well wooden staircases which emphasise fine materials and workmanship through simple detailing. This tradition was continued, albeit with Mannerist twists, in the stairs of more self-consciously avant-garde designers at the turn of the century, such as Charles Rennie Mackintosh (Glasgow School of Art, 1896–99) and Charles and Henry Greene (Gamble House, Pasadena, 1908).

In this century staircase design has given architects the opportunity to exploit the decorative qualities of new materials. After the cast- and wrought-iron excesses of Art Nouveau (for example, Victor Horta's Tassel House, Brussels, 1892–93), innovative staircase design settled into two camps. One, more obviously decorative, transformed the 19th-century cast iron tradition, relying on the sparkle and clarity of industrial glass and steel (Bruno Taut's "Glashaus" and Walter Gropius's Administration Building at the 1914 Werkbund exhibition in Cologne). A brilliant version of Gropius's motif of an open spiral stair in a glass tower can be seen at the De La Warr Pavilion at Bexhill-on-Sea, Sussex by Erich Mendelsohn and Serge Chermayeff (competition 1934). The second type used reinforced concrete to create self-supporting staircases with sweeping ramps rivalling the 18th century, but whose sensuous lines and detailing also owed something to Art Nouveau (Perret's 55 rue Raynouard, Paris, 1929).

The lift and, more recently, the escalator have usurped some of the functional role of the staircase, but have not destroyed its monumental and decorative aspects. Despite the anti-decorative bias of the International Style, even Le Corbusier could design a staircase with an ornamental crystal newel as in his remodelling of Carlos de Beisteguy's apartment in Paris in 1930. The decorative expression of public display and promenade continued at least until World War II: the 1930s saw the Escalier Daru in the Louvre stripped of its mosaics and given its present impressive, bare appearance (Arlander, *Le Nouveau Louvre de Napoleon III*, 1953) but also Basil Ionides's creation of the now-restored Art Deco staircase in the Savoy Theatre, London (1935–36). Today the Modernist tradition of finding decoration through visible construction is being continued in light metal staircases strongly influenced by ship designs, such as the staircases designed by Eva Jiricna for the Joseph Shops, London (1989).

Starck, Philippe 1949–

French architect, and interior, product and industrial designer

Philippe Starck is probably the most prolific, most famous and most commercially successful designer of the late 20th century. He has achieved and maintains this position through a unique insight that is poetic, sensual, humorous and entertaining. Although clearly from the school of Modernism he devotes himself not to the worthy social concerns of its founders but to the exuberant, visceral impulses that are the true fuel of the movement. He is a magnificent showman both in person and in the way that he presents his creations. There is always a strong aspect of spectacle in what he does and his audiences become willing participants in his shows by consuming his objects and environments with voracity.

Starck's work incorporates a number of recurrent motifs; the streamlined teardrop reminiscent of aeroplane wings which may derive from the influence of his father, himself an aircraft designer. Then there is the famous bulbous organic spermatoid squiggle, sexy but playful. There is also the persistent anthropomorphism where a chair resembles its sitter and the metamorphism where a building emerges from the ground like a vast termite; the fantastic mutations of science fiction imagery; and the luxuriant material contrasts: velvet against polished

Starck: Royalton Hotel, New York, 1988

chrome, shiny mahogany against cast aluminium, leather against stainless steel, ribbed plastic against frosted glass.

Starck is thrilled by technology; not by the anodine, clinical form of the computer manual, but rather by the way that those messy creatures, human beings, interact with it and so transform their lives. He loves the way people use it for their pleasure and even corrupt it. Witness his fascination for the dark sci-fi works of Philip K. Dick, whose visions of the future are not gleaming and ordered but hallucinatory, compellingly worded, tumultuous, twisted and deeply fascinating.

In 1977 Starck founded the Societa Ubik, so called after one of Dick's books. Their characters have also been the source of many of the names of his products; Dr. Bloodmoney, Len Niggleman, Miss Yee, Lola Mundo, Ed Archer, Dole Melipone and Tippy Jackson. After attending the Ecole Nissim de Camondo in the 1960s Starck tried a number of ventures including the short lived *Starck Product*. He worked for Pierre Cardin and devised inflatable houses for the Quasar company.

He designed the nightclubs La Maine Bleue (1976) and Les Bains-Douches (1978) before his major break came in 1982

when he was commissioned to redesign the private apartments in the Elysée Palace for President François Mitterrand. This was the start of his celebrity which was augmented two years later by his deliciously melancholic remodelling of the Café Costes, the first of the "designed" café-bars which attracted attention worldwide and which was the destination for many a design pilgrimage. These two projects affirmed his reputation in the eyes of furniture manufacturers such as Driade and Baleri in Italy, Disform in Spain, and XO and Trois Suisses in France who began to put his pieces into production. From this flowed a stream of interiors such as the Manin Restaurant in Tokyo (1987), La Cigale Concert Hall (1987), Café Mystique in Tokyo and the Hotel Royalton in New York (1988), the Salone Coppola hairstylists in Milan (1989), the Teatríz restaurant in Madrid, the Paramount Hotel in New York (both 1990), the Hugo Boss clothing boutique in Paris (1991) and the Delano Hotel in Miami Beach (1995). On a larger scale he began to deal with fully blown architecture including private houses such as Maison Lemoult "Le Sphinx" (1987), a factory for Laguiole Knives (1988), office buildings in Tokyo including

Ashahi La Flame and Nani Nani (both 1989), Le Baron Vert office in Osaka (1990) and a prefabricated “kit” house for Trois Suisses (1993).

Many smaller objects have been spawned by these environments, but Starck’s work as an industrial designer has continued independently. He has produced, among other things, a toothbrush for Fluocaril, door handles for Kleis, the *Hot Berta* kettle, the *Juicy Salif* lemon squeezer, the *Miss Moo* cheese grater and many other items for Alessi, light fittings such as *Ara* and *Luci Fair* for Flos, plastic furniture including the *Dr. Glob* and *Miss Trip* chairs for Kartell, a glass vase range for Daum, a boat interior for Beneteau, furniture for Vitra, a table top range for OWO, a toilet brush called *Excalibur* for Heller, upholstery for Aleph-Driade, water bottles for Glacier, door furniture for FSB and numerous exhibition installations. He has worked for electronics companies Thompson and Saba on a series for television and radio, he has styled bi-folding wardrobe door ranges for Kazed, designed beds for Cassina, and his passion for motorbikes (he keeps one in every main city he visits regularly) has led to a model for Aprilia.

Starck has defined the role of the designer superstar in terms of his own ubiquity and bankability. He performs like a louche cabaret artiste rather than a problem-solving technician, weaving the profane myths of urban life, layering irony on top of irreverence. The production problems of his output do not concern him, they are for others to solve. He has no time for the banalities of construction and execution. He provides the magic, the aroma, the wit, the mood, the prophecy.

CRAIG ALLEN

Biography

Philippe-Patrick Starck. Born in Paris, 18 January 1949. Studied architecture at the Ecole Nissim de Camondo, Paris, 1966–68. Married the designer Brigitte Laurent, 1977 (died 1992): 1 daughter. Worked as a designer from 1968; established Perce-Neige inflatable dwellings company with Lino Ventura, 1969–70; Art Director, Pierre Cardin fashion house, Paris, 1971–72, Chalet du Lac nightclub, Paris, 1973–74, and Centre Ville restaurant, Paris, 1974. Founder-director Starck Product design company, designing for Dorothee Bis, Kansai Yamamoto, Creeks Fashion Shop, Habitat, Baleri, Driade, Idée, Kartell, Casatec, Vuitton, Alessi, Sasaki, Owo, and other firms since 1979; Artistic director, XO furniture company, Paris, since 1985, and Centre Culturel des Arts Plastiques, Paris, since 1986. Instructor at the Domus Academy, Milan, since 1986, and at the Ecole des Arts Décoratifs, Paris, since 1987. Numerous exhibitions since the mid-1980s, including solo shows at the Seibu Museum of Art, Tokyo, 1985, Marseilles, 1987, Palais des Beaux-Arts, Charleroi, 1989, Cape, Bordeaux, 1991, and Design Museum, London, 1992. Recipient of many prizes and awards including the Chevalier de l’Ordre des Arts et des Lettres, 1985, Grand Prix National de la Création Industrielle, 1988, and American Institute of Architects Honor Award, 1991. Lives and works in Paris.

Selected Works

Examples of Starck’s products and furnishings are in the collections of the Brooklyn Museum, New York, Musée des Arts Décoratifs, Paris, and the Design Museum, London.

Interiors

- 1982 Elysée Palace, Paris (interiors and furniture for the President’s office and apartment): François Mitterand
- 1984 Café Costes, Paris (interiors and furniture)
- 1987 Manin Restaurant, Tokyo (interiors and furniture)
- 1987 La Cigalle Concert Hall, Paris (foyer interiors)

- 1988 Hotel Royalton, New York (remodelling of interiors and furniture)
- 1989 Salone Coppola, Milan (interiors and furniture)
- 1989 Nani Nani office building, Tokyo (building and interiors)
- 1990 Asahi Beer Headquarters, Tokyo (building, interiors and furnishings)
- 1990 Teatriz Restaurant, Madrid (remodelling of interiors and furniture)
- 1990 Paramount Hotel, New York (remodelling of interiors and furniture)
- 1991 Hugo Boss Boutique, Paris (interiors)
- 1993 Prefabricated houses for 3 Suisses (buildings, interiors and furniture)
- 1995 Delano Hotel, Miami Beach, Florida (remodelling of interiors and furniture)

Starck has designed furniture for Driade, Idée, Rateri, Baleri and Disform; he has designed domestic goods for Alessi, crystal for Daum, cutlery for Sasaki, and lamp models for Flos.

Publications

“Café Costes” in *Passion* (Paris), February 1985

State Apartments

The term State Apartments was not used as a description of a set of state rooms until the end of the 17th century. Until then these rooms were simply called “lodgings” and the French word *Appartement* appeared only later.

The idea of a set of rooms which functioned as a State (or Great) Apartment however, began to evolve in the 16th century. These rooms were inspired by royal palace design and were intended to provide a set of rooms supplying all the accommodation required for one person. Howard Colvin emphasises how at first State Apartments distinguished a royal palace from a private house (Colvin, 1982), but by the late 16th century similar sets of rooms imitating the State Apartment could also be found in great town and country houses. Courtiers who were familiar with royal houses were thus building grand and expensively furnished rooms or apartments to house the monarch during a visit.

The necessity for a suite of State Apartments stemmed from the daily operation of the English court and the need to regulate contact between the monarch and his important subjects. Clearly subjects needed access to the monarch to solicit favours or to kiss his hand but there had to be some way of determining who had access to him and to what degree. As Hugh Murray Baillie made clear, "the State Apartment ... may be divided into the rooms designed to serve the different aspects of the royal persona: the rooms for State, the Public Rooms for Society, and those private rooms which also served the purposes of government" (Murray Baillie 1967). Certainly there needed to be an orderly way of managing the crowds who flocked to court, by channelling them through a series of rooms to which fewer and fewer had the right of access.

In the Middle Ages, royal apartments consisted simply of the hall and the chamber (which was the bedchamber). But by the 15th century the number of rooms was expanding and the king and queen had separate suites of rooms. The major developments in the ordering of the State Apartments, however, came under the Tudors in the 16th century. Henry VII and Henry VIII developed the concept of *chambres de parade* or rooms of entertaining and etiquette. These were whole suites of rooms set aside for the monarch, used by him and the court and built in the same way in the various palaces constructed or extended for Henry VIII, such as Hampton Court or Whitehall Palace. These rooms reflected attempts by Henry VIII to preserve his privacy and regulate access to him, enshrined in the Household Ordinances known as the Ordinances of Eltham of 1526.

Thus, the reign of Henry VIII saw the crystallisation of the State Apartment and the establishment of a sequence of rooms which was common to all houses, following both the pattern of etiquette and, to a certain degree, the room configurations of the Burgundian court. These new sets of rooms also saw the decline of the Great Hall and its omission from the State Apartment.

The State Apartment was usually located on the first floor with a grand staircase leading up to it. The first room was the Outer Chamber (originally called the Watching Chamber and by the 1620s frequently called the Guard Chamber) which was staffed by members of the Yeoman of the Guard. The next room was the Presence Chamber (also called the Chamber of Estate or Dining Chamber). Henry VIII used this room as the main ceremonial focus of his court and, in the Eltham Ordinances of 1526, he granted access to lords, knights, gentlemen, officers of the king's horse and other "honest personages". The king heard petitions here, in a room which was simply furnished with a canopy of state and a throne for

the king to sit on. The next state room was the Privy Chamber where the king dined and dressed. Access to this room was restricted and was granted only by special invitation from the king. Again, it was furnished with a canopy of state and was the room in which the king dined. After this came the Bedchamber (which was formed into a separate department by James I). Other rooms which were also frequently included in the State Apartment were a Withdrawing Chamber, Robing Chamber, Closet or Oratory, library and garderobe and a gallery which was close to the Bedchamber and accessible from it.

As has been mentioned, the queen had separate apartments which were symmetrical to the king's apartments, for instance at the houses of Clarendon, Woodstock and Westminster. And whereas in France, the king and queen had their apartments on separate floors, one above the other, in England, they were usually on the first floor, situated side by side.

The earliest example of a State Apartment set up for a visiting monarch is in 1534. This was the Exchequer at Calais which was established for the French king, François I. His apartments consisted of a staircase, King's Great Chamber, Dining Chamber, Another Chamber, Robing Chamber, Bedchamber and Library. The Queen's Apartments here included a Great Chamber, Dining Chamber, Robing Chamber and Bedchamber.

The 17th century saw a general evolution of these *chambres de parade* or suites of State rooms. Over the years the Privy Chamber had gradually become less private. By Charles I's reign, for instance, access to the Queen's Privy Chamber was available generally to the nobility. This led to the interposition of a small room between the Privy Chamber and the Bedchamber called the Withdrawing Room, to which access was more restricted. One of the best examples of this is in the new State Apartments built by Sir Christopher Wren for William III at Hampton Court from 1689 to 1694. These included the Guard Chamber, Presence Chamber, Eating Room, Privy Chamber, Withdrawing Room, Bedchamber, Little Bedchamber, Closet and access to two galleries, the Cartoon Gallery and the Queen's Gallery. (By the late 18th century, however, the Withdrawing Room had also lost its privacy and had become the venue of a Public Drawing Room, attended by the king and queen and courtiers of both sexes. This took place at least twice a week under George III.)

Thus, by the beginning of the 18th century the State Apartment in England invariably included two anterooms, one of which was reserved for the more important courtiers, an Audience Chamber, Drawing Room, State Bedchamber and Closet. In 1702, when Queen Anne decided to build a full suite of State Apartments at St. James's Palace, this led to the enlarging of the Council Chamber, the Drawing Room, Chapel, Guard Chamber and lesser Bedchamber and the building of a new wing on the first floor which included a large Drawing Room and on the west side a Guard Chamber, Presence Chamber and Privy Chamber.

Although they were sumptuously furnished with expensive textiles, tapestries and paintings, these *chambres de parade* were also somewhat sparsely furnished. The relatively few pieces of furniture, however, always included a throne or chair, a canopy of state and a state bed. The 2nd Duke of Gramont who visited the Royal Palace in Madrid (the Alcázar) in 1659

State Apartments: design for chambre de parade by J.-F. Blondel, mid-18th century

commented on the furnishings of Philip IV: "In all the apartments there is no ornament, excepting the hall where the king receives ambassadors. But what is admirable are the pictures that all the chambers are full of and the superb tapestries."

The suites of State Apartments in other European palaces followed very similar lines to those in England. In Scotland, the palace in Stirling Castle completed in the 1530s and the Palace at Linlithgow altered at about the same time, both provided a Royal Apartment consisting of a Garde Hall, Presence Chamber and Bedchamber with a garde-robe and oratory behind.

François I at the Château de Fontainebleau in 1533 required a *Salle* or Great Chamber in which he ate, a *Chambre* in which he lived and slept, and behind it a *Grand Cabinet* or Closet into which he could withdraw.

The French king, however, always lived in a more public way than the English monarch. At the palace of the Louvre, the Royal Pavillon built by Henri II included a Grande Salle – or Great (Guard) Chamber, a Great Antechamber (where the king ate in public), the king's State Bedchamber or *Chambre de Parade* with a great canopy hung over the fireplace, and a Closet. This room communicated with the queen's rooms and with the rooms above, by a narrow backstairs (the *petit Degré du Roi*). The principal room was the *Chambre de Parade* which had a balustrade.

At Versailles the State Apartments underwent a number of alterations, but the king's Great Apartment always occupied most of the main upper floor (the *premier étage*) with the private apartments below. Until 1682 the State Apartment was

approached up the King's Stair, through the *Salle de Diane* and *Salle de Mars* (Guard Chamber) into the *Salle de Mercure* with its elaborate silver throne and embroidered canopy and into the *Salle d'Apollon* (the State Bedchamber), with the king's real bedchamber and his great and little Closets beyond. After 1682, however, Louis XIV made some changes, using the queen's staircase to approach his State Apartment into the Antechamber (where the king ate in public) then the second Antechamber (where the Court gathered for admittance to the Bedchamber), into the central Saloon (where the king dressed and received the Court) and then the Closet. The State Bedchamber was moved to the *Salle de Mercure* and the throne to the *Salle d'Apollon*. In 1701 the State Bedchamber was moved again to the Central Saloon and this also became the king's real Bedchamber.

Similarly, in Germany, the Elector Joseph Clement of Cologne used French precedent and the French architect Robert de Cotte in his Electoral Palace at Bonn. His State Apartment there included a Guard Chamber on the first floor at the head of the stairs, a Hall of Knights, an Electoral Antechamber, Electoral Throne Room or Audience Chamber, a State Bedchamber and a Closet.

The Grand Apartment in 17th century Roman palaces, designed for the reception of guests, was as regulated by etiquette as any of its European counterparts. It was also situated at the head of the stairs on the first floor and included a sparsely furnished sala with a *baldacchino* (or canopy) and a *credenza* (or plate rack for service with meals) and benches along the walls, two anterooms (furnished with chairs, stools

and a table), an audience room, bedchamber and closet. Just as in other palaces, or houses, the apartment was recognised as private territory and hosts respected the limits of their guests' apartments.

Similarly, the State Apartments of the Royal Palace in Madrid (whose court was determined by *etiquetas* or court etiquette just like Henry VIII's Ordinances) were on the main floor, accessible by a grand staircase and included a Guard Chamber, Small Hall, Antechamber (for functions and public meals), gallery, royal chapel, small antechamber and a Bedchamber.

Courtier houses tended to take the lead from royal houses in the planning and configuration, furnishing and decoration of rooms. Suites of grand rooms, in a "Great Apartment" were to be found in important courtier houses in both town and country. In the country they were frequently built to lodge and impress the monarch as he visited the countryside on progress. Whole suites of rooms were thus set aside for the king and used by him and the court. These apartments dominated the principal façade, facing the garden and with the best view. They tended to include, at the very least, a Great Chamber, Withdrawing Room, a Bedchamber and Closet. For instance, in 1622 James I instructed Sir Francis Fane to build him a new set of rooms at Apethorpe, Northamptonshire. These included two large rooms before the king's bedroom, a closet beyond, a room for his favourite and access via the gallery or private staircase to the garden. The rooms were decorated with wainscot, elaborately carved fireplaces and plaster ceilings. William Cecil, Lord Burghley, was required to build a splendid set of state rooms at Theobalds in Hertfordshire in 1571 to accommodate Queen Elizabeth and the 150 members of the court who travelled with her. These State Apartments included a decorated Great Chamber, Presence Chamber, Privy Chamber, Withdrawing Room, Bedchamber, a room for pages and a Privy or Great Gallery.

The same need to build a State Apartment to accommodate an itinerant monarch could be seen in the 17th century. At Boughton House, Ralph Montagu, 1st Duke of Montagu, built a "Great Appartment over the Cloysters" in anticipation of William III's visit in 1695. It was situated at the top of the Great Staircase and included the First State Room or Great Chamber (a panelled room decorated with ceiling paintings by Louis Chéron where ceremonial banquets were held), the Second State Room or State Drawing Room, a Bedchamber and Dressing Room (hung with Mortlake tapestries and silk hangings). Similarly, William Blathwayt, William III's Secretary of State for War, built a Great Apartment for the king at Dyrham Park. Situated at the head of the stairs on the first floor, it consisted of a great room over the stairs, an anteroom, a gilded room behind, the best bedchamber, parqueted closet and another closet served by a private staircase.

From the 18th century onwards there was little general change to the establishment and functioning of the State Apartment. For instance, at Kensington Palace in 1718, George I built and decorated a new set of State Apartments on lines identical to those in 17th century palaces. At the head of the king's staircase the visitor proceeded through the Presence Chamber (furnished with a throne canopy and chair of state) into the Privy Chamber, through the Cupola Room into the King's Drawing Room, followed by the King's Bedchamber

and Closets. These rooms were elaborately decorated with ceiling paintings by William Kent and furnished with gilt stools, torchères and marble-topped tables. Similarly, at the White House, Kew, remodelled by William Kent for Frederick, Prince of Wales, from 1732, the State Apartment was on the first floor. According to William Chambers who recorded it in his *Plans, Elevations, Sections and Perspective Views of the Gardens and Buildings at Kew in Surrey* of 1763, the State Apartment: "consists of a gallery, a drawing room, a dressing room and antichamber, a bedroom and closets."

The 17th and 18th centuries were the grand era for the building of the State Apartment and established the pattern for the future. As the development of Buckingham Palace demonstrates in the early 19th century, the approach to the throne room through a number of state reception rooms came to represent an established format in the building of royal palaces. The State or Grand Apartment was a self-contained unit which gave independence to the occupant and provided a number of important reception rooms in which to entertain guests. It comprised at the very least two antechambers, a Bedchamber and a Closet encompassing both the public and the private area for its occupant.

State Beds

The State Bed was a symbol of power and prestige, the most important article of furniture in the wealthy Baroque household. It provided the focal point in the formal etiquette of European courtly life, and was the most expensive item, admired by those permitted to progress through the apartment of state, a series of rooms of increasing richness, culminating in the bedchamber and closet beyond.

This symbolic piece developed from the “best bed” which was listed prominently in inventories from the Middle Ages onwards. Sumptuous descriptions were recorded of costly fabrics and embroidered detail entirely covering the wooden framework, such as “my bed of silk, black and red, embroidered with woodbined flowers of silver” (1434). These extravagant beds, rarely slept in except on occasions of great importance, were also recorded in wills, passed down through the generations and given as favoured gifts by kings and princes. Occasionally, canopies were suspended over them, an arrangement seen in early illustrations and noted in the 1653 inventory of Cardinal Mazarin, where the canopy was hung from silk cords attached to the ceiling. Not only was this type of bed the single most expensive item in the household, but it was also often more valuable than the total cost of the rest of the goods put together.

Their value was in the textile hangings: the tester, headcloth, coverlet, valances and either three, four, or six curtains, often made of differing rich fabrics, brilliant in colour. The best bed at Hardwick Hall was recorded in the inventory of 1601 as a “bedsted guilt ... with double vallans of cloth of golde, cloth of silver; sondrie Coulers of velvet imbrodered fayre with divers armes with portalls and pictures, and with a deep golde frenge”. Gold fringe also edged the six bed curtains made of blue and red satin, “stript with golde and silver”. The best bedchamber at Hardwick was approached through the high great chamber and the withdrawing room where only a privileged few were allowed. Greater public access to the bedchamber was limited in England until the restoration of King Charles II in 1660. Returning from exile in Holland, he adopted the French idea, as elsewhere in Europe, of holding *levées* and receiving honoured visitors in his bedchamber, a formal ritual rapidly imitated by his courtiers. As at Versailles and the court of Louis XIV, the centre of European fashion, the bed was displayed as a ceremonial status symbol at the end of a sequence of state rooms.

The state beds of Louis XIV were placed on a dais, often in an alcove, with a balustrade in front which left the rest of the room free for the king to hold audience and carry out his various public duties. This arrangement of the bed, which has been recreated at Versailles as no original beds survive here from this period, was initially imitated elsewhere in Europe during the second half of the 17th century, both at court and in the homes of rich noblemen. A balustrade of 1680s still remains *in situ* in front of an alcove in the state bedchamber at Powis Castle, in Wales, but elsewhere in Britain they have disappeared, as at Ham House in Surrey, where the splendid state bed used by Queen Catherine of Braganza (wife of Charles II) during her visits, was first recorded in the 1677 inventory. It had hangings of blue and gold cloth of tissue with a deep embroidered trimming. These were the winter hangings;

in the summer this was replaced by another bed made in Portugal with hangings of “spotted tabbie lyned with cherry colloured satine with silk and gold frienge”. A cherry-colour lining still remains on one of the richest beds to have survived anywhere for this period, the king’s bed at Knole, in Kent, made by a French upholsterer in the early 1670s, possibly to celebrate the marriage of the Duke of York (future James II) to Mary of Modena in 1673. This bed, of a rectangular shape commonly known throughout Europe as a “French bed”, has hangings of gold and silver brocade with a spectacular headboard and matching stools and chairs. Such grand beds were often commissioned or given as gifts to celebrate an important occasion like a marriage, and were also used in times of mourning when the woodwork, as in this example, was painted black and the room hung with black or purple serge. The bed given by Louis XIV to the Swedish Ambassador in 1682 still survives at the National Museum in Stockholm.

The fashion for a balustrade and a dais continued well into the 18th century in France, but tended to disappear after the mid 1680s in other countries, particularly in England, Holland and Germany, where the style of the state bed became much taller and more extravagant in design. One such example is the Venetian Ambassador’s bed which is also at Knole, and was described in the royal warrant of 1688 as “a bed of green and gold figured velvet with scarlet and white silk fringe”. As with the king’s bed, it was made for James II and was given as a “perquisite” to the 6th Duke of Dorset, who was Lord Chamberlain at the time of Queen Mary’s death in 1694 – a practice then common in England which enabled the Lord Chamberlain to acquire the full contents of the bedchamber at the death of his sovereign. Not all state beds were removed, as a number still survive in various royal palaces, but the custom has resulted in a number of beds with a royal provenance surviving in country houses in Britain today.

The style of the Venetian Ambassador’s bed with its great height, its elaborate swagged upholstery and full tufted fringe, is similar to the engravings of the Huguenot architect-designer, Daniel Marot (c.1663–1752). Following the Revocation of the Edict of Nantes in 1685, Marot settled in Holland and, with the help of the skilled Huguenot craftsmen who fled France at the same time, played a central and extremely influential role in spreading the Baroque style throughout Europe, numbering among his patrons, Prince William of Orange, later William III of England. He issued sets of designs from the late 1680s which were later published in collected form in 1703, with a fuller edition in 1713. Several of his bed designs illustrate the type of bed called a *lit d’ange* (angel bed), sometimes also called in France *à l’imperiale* or *à la Duchesse*, which was characterised by a tester, not supported by foot posts, but suspended from the ceiling by means of cords or chains. Louis XIV is recorded as having such a bed at Versailles in 1687 and a few beds of this type still survive in some country houses and museums in Europe and America, such as the French embroidered example in the J. Paul Getty Museum in Malibu. However, Marot’s concentration on extraordinary, fanciful confections, as illustrated in his engravings, had little effect on the development of the state bed in France, which remained more conservative and rectangular in appearance than in neighbouring countries, although beds in France placed in more informal settings often resemble his style.

State Bed by Robert Adam, Osterley Park, Middlesex, 1780s

While beds of the *lit d'ange* type appear to have been popular, beds with foot posts have survived in greater numbers, particularly in England, where there are more state beds surviving than elsewhere in Europe. One of the most elaborate to have survived is the Melville Bed, now at the Victoria and Albert Museum, and measuring 4.62 metres (15 feet, 2 inches) in height, with a width of 2.44 metres (8 feet) and length of 2.74 metres (9 feet). It was made in 1697 for the Earl of Melville, William III's representative in Scotland, in the vain hope that the king would come to stay. The bed demonstrates the art of the upholsterer at its most excellent. The crimson silk velvet lined with oyster-coloured silk damask is skillfully displayed in festoons and drapery, bell pleats and choux (ruched silk in the form of a cabbage or rose), and applied to the wooden cornice, carved and pierced to form cartouches and acanthus leaves. The sinuous mouldings of the headboard and tester are outlined with crimson tufted fringe, which also decorates the white silk coverlet. The style shows a great similarity to Marot's designs and can be compared with the surviving tester and headboard from the state bed made by the (Catholic) French upholsterer, Francis Lapiere (1653–1714), for the first Duke of Devonshire. This now hangs as a canopy in the Long Gallery at Hardwick Hall in Derbyshire and is one of the most magnificent items of upholstery surviving from the late 1690s. Both these beds would have been supplied with a case rod from which case curtains were suspended to draw around the bed, to protect it from dust and light when not in use. All Marot's designs show such a scheme, although very few have survived.

A common characteristic of state beds from the Baroque period was the treatment of the fabric, often contrasting in colour, texture and design, and the lavish use of trimmings which remained fashionable in England until around 1714 and the emergence of the Palladian movement. The state bed at Drayton House in Northamptonshire, dating between 1702–05, has green silk velvet "paned" with hangings of rich embroidery and elaborate yellow trimming, whereas Queen Anne's bed of 1714, at Hampton Court, is hung with a single fabric, a rich polychrome cut silk velvet, trimmed with a matching braid but no fringe. Both these examples have a two-dimensional, box-like form, similar to the French state beds of the period.

The state bed continued as an essential item in the household for as long as the formal house plan flourished and rooms of parade were required, a fashion which continued until the Revolution in France. Robert Walpole commissioned William Kent in 1732 to design a magnificent state bed for Houghton Hall, his country seat in Norfolk. Hung with green silk velvet, the bed cornice, treated like a Doric entablature, the curtains and the spines of the double shell motif dominating the headcloth, were enriched with gold and silver metal thread "lace" which alone cost nearly £1200. But it was during the 1730s that the first signs of a more informal lifestyle began to surface in England and, gradually, over a period of about fifty years, the rooms of the state apartment in all but the grandest houses, started to be used for other purposes and the bed was either relegated to another room or destroyed.

This trend was reflected elsewhere in Europe, but state beds continued to be designed and commissioned by the wealthy patron until the end of the 18th century. Thomas Chippendale

in *The Gentleman and Cabinet-Maker's Director* of 1762 illustrated a very elaborate state bed among his various bed designs. Sir Nathaniel Curzon's state bed of 1760 at Kedleston, in Derbyshire, still remains *in situ*, and the green velvet bed designed by Robert Adam for the banker Robert Child in 1776, can also be seen as the culminating point at the end of an *enfilade*. The fashion for floral embroidered detail shown on beds of this period, including Queen Charlotte's bed at Hampton Court, should be compared with the summer hangings of the gilded state bed belonging to Queen Marie-Antoinette of France. Originally woven in 1786, with wall-hangings to match, this stunning floral silk brocade has been copied, and the bed is on display at Versailles. Thomas Sheraton in *The Cabinet-Maker and Upholsterer's Drawing Book* of 1793, illustrated a French state bed and commented that, "Beds of this kind have been introduced of late with great success in England". In his design for an English state bed, he noted that it was suitable for "the dignity of a prince, and worthy the notice of a king, I conceived it necessary to cultivate as much as I could the most exalted ideas, unfettered and unrestrained with the thoughts of expensiveness, which naturally produces meanness of composition, and in many cases injures the ingenious in their designs".

Grand beds continued to be made in the 19th century, particularly for occasions when members of a royal family or important dignitaries came to stay. Although they may have been used for "state" occasions, they no longer played the ceremonial role which characterised the state bed in its heyday during the 17th and 18th centuries in Europe.

Stencilling

Stencilling has often been characterised as a crude substitute for painted decoration or as a cheap alternative to wallpaper. Yet this view obscures both the longevity and the complexity of this craft. The history of stencilling dates back to ancient times and since then it has made an important contribution to Western interior design as an efficient and highly decorative means of embellishing furniture and flat surfaces such as ceilings, walls, and floors. And while it has been used most consistently in smaller, rural homes, it has also proved popular in churches and grand interiors where skilled craftsmen were capable of producing extremely subtle and elaborate effects. Its heyday was the medieval and Renaissance periods but it remained popular in parts of America and Scandinavia throughout the 17th, 18th and 19th centuries. It re-emerged as a fashionable form of decoration in many parts of Europe during the late 19th and early 20th centuries when it was taken up by some of the foremost designers of the time and it is enjoying a resurgence of popularity today.

In its most basic form a stencil is a template that can be cut out of all manner of impervious materials ranging from animal skin to plastic. To achieve a stencil print, the template is fixed onto the surface that is to be decorated, and pigment, or varnish, is applied through the open or cut areas of the stencil. The different techniques include dabbing with a cloth, painting, flicking or stippling with a coarse, blunt brush, and spraying using aerosols or an air gun or brush. The term stencil derives from the French word *estenciler* – to sparkle, or the Latin *scintilla* – meaning spark.

Stencilling is thought to have originated in China some time before 3000 BC, although other early examples exist. An extremely rudimentary form of the technique was discovered in the prehistoric caves at Lascaux, France, where a hand appears to have served as a template of sorts and is outlined in colour. The Egyptians were using stencils made from animal skins or vegetation to decorate coffins (c.2500 BC), and the early Eskimos on Baffin Island made stencils from dried seal skin. Evidence of the Chinese use of stencils has been discovered in the Caves of the Thousand Buddhas, Tunhuang, where silks stencilled with figures were found. The Chinese also used stencils to illustrate manuscripts. And with the invention of paper in the 2nd century AD, they evolved a technique known as Derma Printing in which the stencil pattern was drawn with acid ink, effectively cutting a pattern in the paper without the use of a knife.

Stencilling also flourished in Japan where it was principally used as a means of decorating textiles, paper and leather. It was introduced during the Nara period (646-794 AD) and persisted throughout many centuries until the Meiji Restoration (c.1868) after which time it fell into disuse. Many traditional Japanese patterns became hugely popular with Western artists and designers during the late 19th century. The technique was salvaged and re-established by the Mingei craft movement in

the 1920s and a thriving stencil cutting industry survives today in Shiroko on the Ise Peninsula.

Stencilling was introduced to Byzantium, Italy, France and other parts of Europe via trade routes from Asia and the Far East during the 5th and 6th centuries. By the Middle Ages it had become widely adopted as a means of producing repeating patterns on walls, screens and furniture. In England, stencils were called "doublettes" or "pryntes" and were made of animal skin, oilcloth or soft metal. For much of this period the technique was predominantly used in churches. The decoration of St. Stephen's Chapel in Westminster Abbey, for example, used 80 tin stencils, and other examples included a stencilled pattern in the background to a mural in the Templars Commandary of St. Wulstan, Worcestershire, and a panelled screen dating from the early 1400s found in West Stowe Church, Suffolk.

During the 15th century stencilling was increasingly used as a substitute for expensive ornament, and costly materials such as gold and silver powder and richly coloured pigments were used to create jewel-like heraldic patterns. Popular motifs for decorative schemes also included stars, suns-in-splendour, fleurs-de-lis, armorial devices and monograms. Stencilled walls were also a feature of domestic and secular interiors, and examples survive in Trinity College, Cambridge. Simple geometric designs simulating panelling were favoured in timber-framed Tudor and Jacobean houses but as the technique gained in popularity it was increasingly attacked by master-craftsmen who clearly felt their livelihood to be threatened. Thus, a member of London's Painter-Stainer's Company berated stencilling as a lazy craft that undermined the art of painting and that stifled ingenuity.

The introduction of wallpaper from the early 16th century, placed an additional strain on decorative painters and proved a dangerous rival to stencilled effects. Indeed, wallpapers themselves were sometimes stencilled: the earliest examples were printed in monochrome from engraved wood blocks, but from the 17th century areas of colour were applied through crudely cut stencils. Such papers were used throughout northern Europe as box-linings or on the walls and ceilings of lesser rooms. As production methods improved, however, this technique was increasingly replaced by more sophisticated methods of block-printing. And with the introduction of elaborate polychrome patterns and flocked wallpapers that imitated more costly woven hangings and silk brocades, wallpapers became more exclusive. The imposition of heavy excise duties in England from 1712 also made them more expensive, and for much of the 18th century wallpaper was a luxury item that only the comparatively wealthy could afford. Within this context, more modest households reverted to the traditional technique of stencilling patterns directly onto walls. As late as 1839 the architect J.C. Loudon declared, "This mode of ornamenting walls of rooms is not unsuitable for cottages of the humblest description on account of its cheapness and because in remote places or in new countries, it might be done by the cottager himself, or by the local plasterer or housepainter", and in rural areas this practice continued until the end of the 19th century.

For much of the 18th century it was common practice in middle-income homes to decorate floors. Clay or plaster floors were often painted to resemble marble blocks or were covered

Stencilling: stencilled bedroom at American Museum in Bath, with stencilled bed covers, chair backs and walls

with a terracotta paint to recall traditional, rustic floors. Wooden floors were also stencilled, a practice that was popular in the United States but that did not become fashionable in England until c.1800. Both small all-over patterns containing floral, chequered and other geometric motifs, and large, complex, single images were used, and particularly fine examples of stencilled floors survive in the dining room at Crowcombe, Somerset, and in the Chapel drawing room at Belton House, Somerset.

The fundamental simplicity of the stencilling technique greatly encouraged its use in America and Australia. The remoteness of these colonies, where the only wallpapers available were those imported via the hazardous and costly sea voyage from Europe, coupled with the primitive nature of the first dwellings and the modest circumstances of their inhabitants, made this technique an ideal form of decoration, and it proved especially popular in America throughout the 17th and 18th centuries where numerous interiors included simple stencil schemes of flowers and other small motifs on white-washed walls. Many of the motifs soon acquired symbolic

meanings – the eagle represented liberty, bells and hearts meant joy, the pineapple symbolised hospitality, and the willow immortality – and American stencilled decoration evolved a spiritual language that was independent and distinct from European usage. With only limited access to European pigments, the early settlers also made their own paints using local materials such as earth clays and brick dust mixed with skimmed milk.

As the New England communities became more established and prosperous, demand for decoration increased, and craftsmen travelled between settlements and offered a range of patterns and effects whose design was intended to reinforce the social hierarchies within the early American home. The parlour and / or dining room (the best rooms) received most attention and a typical stencilled scheme might include friezes, borders and stencilled wall, with additional decoration on the mantelpiece and skirtings. Mantelpieces were decorated with large symbolic motifs while simpler repeating patterns were often used in friezes and borders painted on the walls and ceiling and around doors and window frames and along the skirting.

Architectural ornament and vertical bands of repeating patterns were also frequently used to cover the main sections of the wall. Secondary or private rooms were decorated less lavishly but even here stencilling was rarely confined to just the walls. Bedrooms, for example, included stencilled bedspreads while other rooms might include stencilled furniture and floors and a bedroom of c.1825, reconstructed in the American Museum in Bath, England, underlines the all-encompassing nature of such decorative schemes. Surviving stencilled interiors have been found as far apart as New England, Kentucky, Ohio and Texas, demonstrating not only the popularity of this craft but also the mobility of travelling craftsmen. Several of these craftsmen were both highly regarded and extremely prolific; Moses Eaton, who practised in the early 19th century was responsible for hundreds of interiors in New England.

Such was the popularity of stencilled and painted furniture that production ultimately became standardised. The early settlers had been forced to make all their own furniture and domestic equipment, but by the time of the Revolution, furniture production had become one of America's foremost industries. Much of what was produced catered for a wealthy, sophisticated market and was too expensive for poorer, rural dwellers to afford. Instead, they employed local joiners to make simple, sturdy furniture from local woods. Nevertheless, they craved ornament and, unable to reproduce the fashionable gilded and inlaid furniture made by early 19th century urban cabinet-makers, provincial and indigenous craftsmen refined their use of stencils to simulate the crisp edges of inlaid patterns, and employed materials such as bronze powder to copy gilt effects. As demand for stencilled furniture increased, designs became flatter and less detailed in an effort to speed up the production process. During the 1820s Lambert Hitchcock established a factory that mass produced the parts for stencilled furniture. These were sold as self-assembly kits and they were distributed throughout America. Hitchcock furniture, as it became known, was decorated with formulaic designs strongly influenced by contemporary European fashions; such was the popularity of this work that Hitchcock's home town in Connecticut was renamed Hitchcockville in recognition of his contribution to the local economy and the furniture industry.

While stencilled decoration and furniture remained important in rural areas and persisted as a folk and craft tradition until the early 20th century, the widespread availability of cheap, mass-produced wallpapers meant that it became increasingly marginalised within more mainstream interiors in Britain and America from the mid 19th century. With the advent of the Gothic Revival, however, there was renewed enthusiasm for stencilled decoration among leading architects and artist-designers. Indeed, stencilling was often embraced as an ideologically appropriate medieval craft, and pattern books like William and George Audsley's *Polychromatic Decoration as Applied to Buildings in the Mediaeval Styles* (1882) included numerous illustrations of highly elaborate designs copied from or inspired by medieval originals. The Aesthetic fashion for Japanese art also encouraged an interest in stencilled effects with typical examples incorporating motifs such as simple, geometric ornament and heraldic emblems or exotic flora, butterflies and birds. The most elaborate stencilled schemes frequently resembled murals more than applied decoration; they enhanced almost every architectural feature within the

room and were especially favoured on arches, ceilings, and in the dado and frieze sections of walls. They were also often designed by architects and artists and were executed by highly skilled artisans. The architect William Burges produced his own designs for stencils which he used to decorate the interiors and furniture at Cardiff Castle, Castle Coch and Tower House. And William Morris reputedly used stencils made by the decorators Leach of Cambridge, although apart from a ceiling in a villa in Bromley designed by Ernest Newton there are no surviving examples of his work.

By the end of the 19th century stencilling had become a well-established form of decoration in many artistic interiors and its use persisted throughout the early decades of the 20th century. The technique was particularly well-suited to the flat, undulating patterns characteristic of Art Nouveau and it was used by several well-known British and European designers associated with this movement, including Charles Rennie Mackintosh, M.H. Baillie Scott, Victor Horta, Hector Guimard and Henry van de Velde. In 1920, A.S. Jennings and G.C. Routhery's *Modern Painter and Decorator* devoted an entire chapter to stencilling, providing useful advice on the best materials and methods, but by the late 1930s the practice was no longer fashionable and had all but died out.

The recent interest in rustic styles of decoration, exemplified in Laura Ashley's traditional, quintessentially English wallpapers and textiles has encouraged another revival of the stencilling technique. Aimed at middle-class consumers, Laura Ashley's home decorating manuals recommend stencilling as a simple yet effective way to decorate furniture, walls and floors, and the company sells stencils containing naive floral motifs that are not unlike those used by early settlers in New England. Publications like Jocasta Innes's *Paint Magic* (1981) have proved equally influential in promoting a taste for vernacular styles. Addressed to a general audience rather than professional decorators, this book provides advice on appropriate patterns and a step-by-step guide to stencilling techniques to enable home-owners to reproduce the effects of rustic and traditional interiors themselves. In contrast to the amateur involvement encouraged by Laura Ashley and Innes, professional stencil artists such as Lyn le Grice have produced work that demonstrates the immense sophistication that is possible with the stencil technique. Her work draws on Japanese, Celtic, Gothic and other important historic precedents and is used as an alternative to painting in the creation of large-scale pictorial mural schemes. As ever, the practice of stencilling is limited only by the dimensions of the surface to be decorated, the imagination of the artist or craftsman, and the perception that stencilling is only a "shorthand" for painting.

Stern, Giovanni 1734–1794

Italian architect

Little is known about the career of the 18th-century architect Giovanni Stern, save that he was the designer of the magnificent interior of the Salone d'Oro in the Palazzo Chigi in Rome. The redecoration of this interior was commissioned in 1765, and completed in 1767 on the occasion of the wedding of Don Sigismondo Chigi and Donna Maria Odescalchi, members of two of the most important Roman families. The perfectly preserved interior is situated on the second floor overlooking Piazza Colonna, and today houses the offices and official residence of the Italian Prime Minister.

Under Stern's direction a team of important artists collaborated on this decorative commission, including the silversmith and sculptor Luigi Valadier, the sculptor Tommaso Righi and the painters Giovanni Angeloni and Nicola La Piccola. Other less familiar collaborators were the stuccoist Francesco Cappelletti and the wood-carver Andrea Mimmi. The salon's severe lines give it a Neo-Classical appearance. In their simplicity, the slender Ionic half-pilasters, rising from the dado rail to support the entablature decorated in low relief, echo the austere and barely perceptible decoration of the candelabra on the wall and the classical bucrania arranged along the dado.

Pairs of female figures modelled fully in the round in stucco are placed on the cornice of two doors, each pair flanking an oval painting. These were carved by Tommaso Righi, who had also worked at the Casino Borghese, and who was also responsible for the low-relief panels decorating the walls, containing figures of young girls dancing within square or oval frames, and the six smaller low-reliefs depicting playing Cupids. The corner consoles, the only original furnishings still *in situ*, support two stucco caryatids. The ceiling is made up of hexagonal coffers in the centre of which is a painting of Diana and Endymion by G.B. Gaulli, called *il Baciccio*.

The bases of the pilasters and the overdoor frames are made in the typical Roman *peperino* stone, and were carved by Lorenzo Cardelli. Pasquale Marini and Andrea Mimmi were responsible for the woodwork. The former carved the refined mirrored doors and window shutters, while the latter was active primarily as an inlayer rather than a carver. His skill is illustrated in the high quality of the floor, whose intricate design reflects that of the ceiling, and culminates in a central flower garland. The beautiful gilding, which documentary evidence suggests is by Giovanbattista Stazi, enhances the sober richness of the interior decoration. The masterpieces of the Salone d'Oro are the gilt-bronze flowers, leaves and birds that frame the six large mirrors, forming candle-branches with decorative swags suspended from them. This gilded vegetation was cast and chased by Luigi Valadier, and the lightness, delicacy and frivolity of these undulating garlands of flowers lend a *rocaille* touch to the interior.

Stern's only other documented commission was the project for the building in Via dei Prefetti, carried out in 1779. Here he abandoned Baroque forms still current in 18th-century architecture through an expression of original ideas illustrating an abundant creativity.

MARIELLA PALAZZOLO

Biography

Born in 1734, the son of Ludwig Stern (1709–77), and part of a dynasty of artists active in Rome in the 18th and 19th centuries. Trained as a sculptor and worked with his father until 1758. Married a Frenchwoman, Maria Joséphe Prò, 1756. Restored churches and houses in Ariccia for Sigismondo Chigi, 1771. Designed the project for a Benedictine convent, Rome, 1777–79. Architect of the papal palaces, 1794. In litigation over building for Count Rospigliosi, 1794. Died in 1794. His son Raffaello was responsible for the Braccio Nuovo Chiaramonti at the Vatican Museums.

Stevens, Alfred 1817–1875

British painter, decorative artist, designer and sculptor

Alfred Stevens is far less well known today than he should be. In part this is because few of his interior schemes were executed, or even completed, and many of those that were have since been dismantled. Much of his work in industrial design was poorly documented and his practice of endlessly reworking his drawings makes attributions difficult. Furthermore, his best work was in the Renaissance style, at present an unfashionable historic style, and the breadth of his output – from industrial designs in metal to painting and carving for individual commissions – makes his work difficult to assess.

Stevens drew many studies of Renaissance architecture and applied art, and copied antique and later works while in Italy, and his earliest interiors (executed for Leonard Collmann, whom he may have met while at the School of Design) were for two Italianate style houses. Both featured figure panels in classical poses (painted by Stevens): some were symbolic, for example the draped, seated figure of Truth at Deysbrook, and others were narrative as in the case of the paired female heroines from *The Faerie Queene* at Kensington Palace Gardens. Such schemes dominated by large-scale figures, revealing a sculptor's vigour and knowledge of form, enclosed by ornate borders of Renaissance-inspired formalised foliage and scrollwork, echoed in a frieze, were to become a hallmark of his work. Those at Deysbrook were probably influenced by Raphael ceiling paintings in the Vatican.

Stevens had also studied carving and metal casting while in Italy and used his knowledge of the latter when designing for Hooles and other ironfounders. The *Blue and Gold* stove he designed for the firm included a frieze of winged female caryatids with foliage tendrils, a form that was used again on his dramatic and instantly recognisable andirons, named "figure dogs" as they feature caryatids or masks. The *Pluto* stove included a classical allusion in the fireback, cast with a relief of the Rape of Persephone. Stevens's ornament was not merely decorative; piercing in the design enabled the circulation of air, while a Coalbrookdale piece featured an interchangeable grate surround and overmantel.

Stevens's designs for Hooles were shown with great success at the Great Exhibition of 1851 where the firm's products were transferred to the "Furniture & Decoration" class. This brought further commissions, for example for the Queen's Waiting Room at Paddington station. This scheme combined Renaissance-style architecture with life-size figures and a dome divided up into geometric compartments. Stevens provided a gold and white and an alternative blue scheme, offset by gold silk on the walls. Vertical and horizontal division of a dome into ribs and bands was used again in his design for the Reading Room of the British Museum, each bay representing an aspect of man's achievements, an arrangement which may

have been inspired by Raphael frescoes. In a final design for the decoration of a dome, the mosaics for St. Paul's Cathedral, the surface was again divided up to provide two cycles of circular decoration, with sculptures of Old Testament figures at the base. Of the three schemes only a small part of the St. Paul's design was ever executed.

Robert Stainer Holford, owner of Dorchester House, Stevens's most important executed interior, wrote that when he engaged Stevens "I told him plainly that I was not prepared to embark on a system of decoration to be charged for as fine art". But Stevens's ideas on the role of a decorative artist were at variance with his patron's: his painstaking techniques, whether carving frames or endlessly reworking sketches and models, and his extravagant use of expensive materials were less the mark of a commercial artist than a sculptor. Dorchester House was designed by Lewis Vulliamy as an Italianate palace, and Stevens, whose reputation for Renaissance designs was fuelled by his pupils at the School of Design, may have been intended to decorate all the principal rooms. It is likely that his working methods made this impossible, although he probably designed the doors, together with the Saloon chimneypiece and some wall paintings in the Gallery. His main project, stretching over almost 20 years, was the Dining Room. The room was more reminiscent of an ecclesiastical than a domestic interior, and its focus was an apse-shaped niche enclosing a buffet and cooler, flanked by a vast marble chimneypiece supported by two life-size female caryatids. Corinthian pilasters alternated with walnut framed mirrors, carved by Stevens with grotesques on a stippled ground. Walnut and gold were repeated in the buffet niche with its half-dome, surmounted by an elaborately carved pediment, surrounded by columns. Stevens himself never completed the carving of the chimneypiece; it was originally designed with a hood-shaped overmantel which he later modified to a simpler (but less successful) plinth with a putto and shield, and larger caryatids. White marble for the frieze and figures set between deeply veined greenish slabs contributed to the effect. The scheme was to have been completed by ceiling paintings, based on the *Chronicles* of Geoffrey of Monmouth, but the drawings were never completed. Curtains with tasselled valances and elaborately carved chairs upholstered in embroidery and fringed were, however, designed for the room.

Many of the ideas from Dorchester House were reused in cheaper materials in Stevens's own home at Eton Road. The best documented interior, the library-drawing room, had dado-height mahogany panelling from which projected four bookcases, pilasters and an extraordinary sideboard supporting a sarcophagus-shaped cabinet on scrolled feet, decorated with four female allegorical heads in profile and finished with a familiar combination of architectural elements. The design of this sideboard, and the caryatids for the Dorchester House chimneypiece, preoccupied Stevens and appear on other sheets of densely worked drawings. The Wellington Monument, on which he was working concurrently with these commissions, may have inspired the sarcophagus form. Stevens designed many other items of furniture for Eton Road but it is uncertain how much was produced.

The Dorchester House Dining Room was Stevens's most complete interior, but his slow pace of work and lengthy process of preparatory drawings and models indicated that he

found it hard to visualise, let alone realise, a completed project. He has been accused of a lack of originality in his use of Renaissance elements; but the vast body of surviving drawings indicate that he was constantly reworking forms to be used in a wide range of materials. His experience working with potters and ironfounders gave him a valuable insight into the practical problems of designing for production, and pieces such as the andirons designed for Hoole's suggest that he was able to do so without any sacrifice of quality.

CLARE TAYLOR

See also Renaissance Revival

Biography

Born in Blandford Forum, Dorset, 30 December 1817, the son of a house painter. Lived in Italy 1833–42; studied in the Academy, Florence, and in the studio of the Danish sculptor, Bertel Thorvaldsen (1770–1844), Rome. Returned to England, 1842. Active as a painter, decorative artist and designer from the early 1840s. Tutor, Government School of Design, London, 1845–47; chief designer to the ironfounders Hoole, Robinson & Hoole, Sheffield, 1850–c.57. In London from 1851 working on various decorative and design commissions including Wellington Monument from 1857, and the decoration of the dome of St. Paul's from 1862 (both uncompleted). Died in London, 1 May 1875.

Selected Works

Large collections of Stevens's drawings, covering most aspects of his decorative and design work, are in the Drawings Collection, Royal Institute of British Architects, and the Victoria and Albert Museum, London. Additional drawings are in the Walker Art Gallery, Liverpool, and the Tate Gallery, London; several of Stevens's designs for Hoole and Company are in the National Gallery of Victoria, Melbourne. Examples of Stevens's furniture are in the Victoria and Albert Museum and the Walker Art Gallery; the Walker owns the decorations from Deysbrook House and much of the furniture and fittings from Wellington House.

Interiors

- 1847 Deysbrook House, West Derby, Liverpool (decoration of the dining room and drawing room): Richard Benson Blundell-Hollinshead-Blundell

- 1854–55 11 Kensington Palace Gardens, London (decoration of the drawing room): Don Christobal de Murieta
- 1854–55 Reading Room, British Museum, London (unexecuted designs for the decoration)
- 1856–75 Dorchester House, Park Lane, London (interior fittings and decoration): Robert Holford
- c.1862 Dome, St. Paul's Cathedral, London (designs, most unexecuted, for the decoration of the dome)
- 1866–75 Wellington House, Eton Road, Hampstead, London (building, interiors and furniture): Alfred Stevens

Stevens supplied designs for interior decoration for the decorator and upholsterer Leonard Collmann from 1847. He designed metalwork, including stoves, for Hoole and Co., Sheffield, 1850–57; chimneypieces for Coalbrookdale Iron Company, late 1850s; and ceramics for Minton and Co., Stoke-on-Trent, early 1860s.

Further Reading

A comprehensive account of Stevens's life and career appears in the RIBA catalogue 1975 which includes a long bibliography of primary and secondary sources.

Stickley, Gustav 1858–1942

American craftsman, designer, manufacturer and entrepreneur

Gustav Stickley was the leading proponent of the Arts and Crafts Movement in America. A furniture-maker by trade, he became a tireless propagandist of what he called "Craftsman" ideals during the opening years of the 20th century. As editor of *The Craftsman* magazine, which ran from 1901–16, Stickley advanced his ideas about the benefits of the simple life, discussed and illustrated the home environment in which it should be lived, and presented images of the simple art and craftsmanship – from furniture to full interiors – which should inform that environment. As a designer Stickley promoted the honest use of materials, simple lines, and quality production, and he eschewed elaboration, artificiality, and lack of standards in art as well as in life. His ideas concerning furniture design developed quickly into a definition of appropriate settings in the form of his designs for Craftsman Homes. Less avant-garde than Frank Lloyd Wright, Stickley was nevertheless more responsible than any other American designer of his generation for creating and shaping the taste for a simple and high-minded middle-class home environment.

The establishment of the Craftsman Movement at the Crouse Stables in Syracuse, New York, where Stickley rented office and showroom space in 1900, represented a significant coming together of 19th-century aesthetic forces and progressive ideals and exerted a formative influence on Stickley's ideas. It was a culturally mixed environment juxtaposing the simple, handicraft-oriented, and moral world of John Ruskin, William Morris, and American disciples like Stickley, with the affectations and urbane ostentations of the Late Victorian era.

Stickley: library for Craftsman house, 1903 (with E.G.W. Dietrich)

But it was also a reformist environment not yet ready to rush headlong into the factory production world of an emerging Modernism. The Crouse Stables (1887–88) was an urban Queen Anne building designed by up-state New York architect Archimedes Russell. D. Edgar Crouse, its owner, had commissioned Herter Brothers, the prominent firm of New York decorators noted for their rich Aesthetic style of furniture designs, to decorate his elegant bachelor quarters in the building. The interior – with rosewood and mahogany paneling, Persian carpets, and Chinese ceramics arranged in a generally oriental setting – could not have offered a more dramatic contrast with the “angular, plain, and severe” designs for “New” furniture which Stickley was to promote. He had already exhibited his austere and restrained (ironically called “fancy”) furniture at the July 1900 trade show in Grand Rapids, Michigan, a town associated with the lower end of the furniture market. And he intended to orchestrate a transformation of American taste, from Herter opulence, elaboration, and display, to the Craftsman idea of simplicity, integrity, and restrained artistic sensibilities.

In October and again in December, 1900, Stickley’s solid and plain furniture designs were published in *House Beautiful* (founded 1896) and praised as “sensible” by its editors. *House Beautiful* was a new art magazine dedicated to good living whose promotion of progressive aesthetics and craftsmanship included early endorsements of Frank Lloyd Wright. Moreover, in October 1901, from the Crouse Stables offices, Stickley began publishing his own magazine, *The Craftsman*. He dedicated the first issue to William Morris, and the second to John Ruskin. In 1903, within this same building (which Stickley referred to as his Craftsman Building, even though he only rented space in it), he sponsored an Arts and Crafts exhibition. He modeled his production company established in nearby Eastwood, which he called the United Crafts, on medieval guilds, and he likened it to Morris and Company in England. He offered profit-sharing to his workers for a few years (as close to Morris’s socialist ideals as he would get in practice), and he started publishing catalogs of his furniture. Early designs included tea tables and case pieces, which echoed Mackmurdo and Voysey, as well as Bungalow tables and chairs

and the notable Eastwood armchair, which offered models for Wright.

Many designers of the English Arts and Crafts Movement – A.H. Mackmurdo (1851–1942), M.H. Baillie Scott (1865–1945), Charles F.A. Voysey (1857–1941), Edwin Lutyens (1869–1944), and the Scotsman Charles Rennie Mackintosh (1868–1928) – were architects who turned to furniture design, because they could not find well designed and “well wrought” furnishings appropriate for their houses. Stickley’s development was in the reverse direction: he was a furniture-maker whose designs were crafted by workers trained in hand methods of production and who turned to architectural design in order to provide settings appropriate for his Craftsman furniture. His Craftsman Homes, from the point of view of both architecture and interior design, would be as honest and sincere, as simple and unaffected, as the chairs and tables emerging from his Eastwood United Crafts furniture guild.

Thus, *The Craftsman* began to publish house designs, a feature which appeared occasionally in early issues and monthly after 1904. Lacking any personal training in architecture, Stickley got early assistance in residential design from architect E.G.W. Dietrich, and together they designed and published, in May 1903, the first house to be labeled “The Craftsman House.” A month later, Stickley hired Harvey Ellis (1852–1904) who produced beautiful renderings of artistic Craftsman houses in the spirit of Baillie Scott and Mackintosh during the seven months that he worked for the magazine. During this same period *The Craftsman* initiated the Home Builders Club providing free house plans to readers, some 200 of which were distributed in the next dozen years. Finally, in 1908, Stickley bought land in Morris Plains, New Jersey, in order to build a cooperative community, combining crafts production and farming, and inaugurated the Craftsman Farms. He announced his intention to build his home there as an embodiment of Craftsman ideals, to provide a clubhouse for lectures and exhibits, and to build a school.

Stickley’s mission (only partially fulfilled) at Morris Plains was to lead by example; his ultimate goal in all these activities was to spread the Craftsman aesthetic and value system throughout the land, an intention that he to a large extent fulfilled. The full scope of Stickley’s apostolic dissemination of the Craftsman ideal became evident as Craftsman plans were distributed nationally, building contractors copied the emerging “bungalow” style, and a generic “Craftsman” style became the dominant residential aesthetic for thousands of American homes before World War I.

Moreover, Gustav Stickley’s rivals (including his own brothers, Leopold and J. George) began to mass produce copies and off-shoots of Craftsman furniture. The Stickley brothers, operating the Onondaga Shops in Fayetteville, New York, produced their own catalog of L. & J.G. Stickley furniture as early as 1905; by 1910 they had started labeling their pieces “Handcraft” furniture. Gradually, a generic “mission furniture” aesthetic evolved. This included Gustav Stickley’s heavier, primitive, and austere *Eastwood* pieces; the Harvey Ellis’s lighter yet still rectilinear pieces, occasionally inlaid with ornament; and the widely disseminated, factory productions of L. & J.G. Stickley and other later Grand Rapids furniture-makers. All these examples were simple, solid and well made, usually constructed from fumed oak and undecorated, and

honestly displayed their plank construction. The same description could apply to Craftsman-inspired houses: simple and unadorned, honest expressions of carpentry and joinery, made of natural materials, and well crafted. They were artistic homes filled with mission furniture for middle-class America.

The success of Stickley's influence is further evidenced by the extensive presence of Craftsman-influenced bungalows in mail-order catalogs such as Sears Roebuck and Company's "modern homes" catalogs, where "The Westly" model, echoing a farmhouse from the March 1909 issue of *The Craftsman*, was popular enough to be published from 1913–29. When *The Craftsman* ceased publication in 1916, Sears "Modern Homes" catalogs seemed to take up the mantle with increased vigor, offering mail-order Craftsman-inspired houses through the 1920s and after.

Stickley's rapid expansion during the second decade of the 20th century led to the over-extension of the Craftsman empire. Having moved his headquarters to New York City in 1905, he took the daring step in 1913 to consolidate all the Craftsman enterprises (except furniture production) in a leased 12-storey "Craftsman Building" in the heart of the city's prime shopping district. Under one roof he would provide showrooms for furniture, draperies, furnishings, and rugs, four floors of "The Craftsman Permanent Homebuilders' Exposition", Craftsman workshops, the editorial offices of *The Craftsman* magazine with its architectural and service departments, and on the top two floors The Craftsman clubrooms, library, lecture hall, and restaurant. But the speed with which he embarked upon this enterprise, and its scale, were all too much and, unable to finance the building's lease, Gustav Stickley and The Craftsman, Inc. filed for bankruptcy, \$230,000 in debt in the spring of 1915. J. & G.L. Stickley took over the Eastwood factory, and Gustav returned to Syracuse to live in the house whose interior he had remodeled in 1902. Three years after the bankruptcy, Gustav's wife died (1918), but Gustav, then 60, lived on until 1942 when he died at age 84.

Despite the collapse of the Craftsman enterprises, it cannot be said that Stickley failed to achieve his goal of reforming American architectural and interior design. In 1913 he wrote that "the Craftsman Movement stands not only for simple well made furniture, conceived in the spirit of true craftsmanship, designed for beauty as well as comfort, and built to last," adding that "it stands also for a distinct type of American Architecture, for well built democratic homes planned for and owned by the people who live in them, homes that ... meet the needs of wholesome family life." These comments were almost a paraphrase of William Morris's definition of art as "made by the people and for the people, a joy to the maker and the user". Stickley had opened the 20th century with a call to reform Victorian excesses and to create a modern home design. His Craftsman aesthetic advocated radical simplicity and integrity in art and life, and in the end he succeeded in promoting a revolution in taste for American interior design.

ROBERT M. CRAIG

Biography

Born Gustave Stoeckel, in Osceola, Wisconsin, 9 March 1858. Eldest son of immigrant German parents; father a stonemason. No formal training but worked as a stonemason from the age of 12. Family

moved to Brandt, Pennsylvania, c.1874; worked as a woodcarver in his uncle's chair factory, Gardner, Massachusetts. Married Eda Ann Simmons, mid-1880s (died 1918). Established Stickley Brothers, a wholesale and retail furniture business, with Charles and Albert Stickley, in Binghamton, New York, 1884; Director of Manufacturing Operations, New York State Prison, Auburn, 1892–94. Travelled to Europe, 1898. Established Stickley-Simonds Co., Syracuse, New York, by 1894; set up Gustav Stickley Co., 1899; re-formed as Craftsman Workshops producing furniture, lighting, metalwork accessories and textiles, 1904; opened showroom and offices in New York City, 1905; took over large new office building, New York, 1913; business declared bankrupt, 1915; Craftsman Workshops taken over by L. and J. G. Stickley, 1918. Editor and publisher of *The Craftsman* magazine, 1901–16. Established the Craftsman Farms project, Morris Plains, New Jersey, 1908–17. Exhibited at Grand Rapids Furniture Fair, 1900, and Louisiana Purchase Exposition, St. Louis, 1904. Died 21 April 1942.

Selected Works

Designs and architectural drawings relating to Stickley's Craftsman Houses are in the Avery Library, Columbia University, New York; plans and drawings of the interiors appeared in *The Craftsman* from c.1903. Examples of Stickley furnishings are in the Metropolitan Museum of Art, New York and the Los Angeles County Museum of Art.

Interiors

- 1902 Stickley House, Syracuse, New York (interiors and furniture)
- 1910 Stickley House, Morris Plains, New Jersey (building, interiors and furnishings)
- c.1911 I.R. Williams House, Ossining, New York (adaptation of Craftsman House; interiors and furniture)
- 1912 Dumbane, Washington, DC (adaptation of Craftsman House; interiors and furnishings): Mr. and Mrs. S. Hazen Bond
- 1914 Charles B. Evans House, Douglaston, New York (building, interiors and furnishings)

Publications

The Craftsman, October 1901–September 1916
Craftsman Homes, 1909; reprinted, 1979
More Craftsman Homes, 1911; reprinted 1982

Stools

Stools represent the oldest form of furniture, and their versatility has made them ubiquitous across cultures to the present day. The earliest were made of hewn or burnt-out logs, carved stone, and coiled fiber. Wicker and cane furniture was already common in ancient China, India, and Egypt, and intricately pierced and sculpted bronze stools survive from Pompeii, but stools are most frequently made of wood. The basic stool consists of three sticks pegged through a rough wooden seat. With the addition of a fourth leg to a riven or sawn plank, the form of nearly every constructed stool to follow was determined. As joinery developed, their construction and decoration became increasingly elaborate, but even the introduction of modern materials has not altered the stool's essential configuration.

Representations of Sumerian and Egyptian stools from the 3rd millennium BC include open, box-like constructions of slats or woven reed alongside square stools with leather or rush seats and carved wood or ivory bull's-leg supports. From the 12th Egyptian dynasty onwards, lions' legs replaced those of bulls, but the form remained quite constant, with the legs facing one direction, like a live animal. Nearly all the extant wooden (usually cedar or ebony) stools have deeply curved seat rails on four sides, imitating the effect of slung leather, and woven seats were also made in this manner. Square stools with thin diagonal struts, three-legged stools, and low foot-stools were used in ordinary households, but with inlay, gilding and paint, the same forms were made suitable for royal burials.

Folding stools developed in Egypt sometime between 2000-1500 BC, apparently for military use, and evolved as potent symbols of political and religious authority. A striking example from Tutankhamun's tomb has ebony legs in the form of streamlined ducks' heads, with ivory inlay and gold mounts;

the curved wooden seat was painted to resemble a leopardskin, limp tail and all. Greek, Etruscan, and later Roman folding stools (often augmented by foot-stools) were also ceremonially important and almost certainly derive from Egyptian forms. The most common Grecian type was carved with lions' legs facing inwards, a balanced but disconcerting solution; others ended in cloven hooves. Folding stools were in use in China as seats of honor by about 25 AD, but were later supplanted by the folding chair. Japanese samurai adopted them by the 9th century, and lacquered folding stools still serve in Japan for coronations.

In Rome, folding stools were emblems of official and imperial power, and although the *sella curulis* was richly cushioned and draped, the hangings never concealed its X-shaped framework. This form spread throughout the Empire, and folding stools of metal and wood, decorated with animal-head terminals and carved or inlaid interlace patterns, were possibly the most important furniture of early medieval Europe. Their ecclesiastical role as the bishops' *faldstool* survives in the kneeling altar stool still used by bishops and popes. French royalty used them from the 5th century, and the ornate gilt or silver-mounted *pliants* which Louis XIV resurrected at Versailles were conscious invocations of medieval kingship. *Pliants* and the related *tabourets* were richly upholstered with figured velvet, tapestry, tassels and fringe, and to be seated on one at court was a privilege reserved variously for duchesses, ministers and other dignitaries. (Although its name derives from *tambour*, or drum, the *tabouret* was a rectangular stool.) Relics of a more mobile aristocracy, *pliants* were only symbolically portable at Versailles: as groups of six or eight were ordered en suite for bedchambers, and dozens more lined the walls of public rooms, they hardly needed to be moved about. Later versions of this type in Greek and Egyptian revival styles made no pretense of actually folding.

Stools also maintain an archaic significance among most of the traditional kingdoms of the Guinea Coast and the Zaire (Congo) River basin; the Ashanti of northern Ghana call their king's clan "the Royal Stool" and honor the blackened stool-thrones of former kings with special ceremonies. Carved from a single block of wood, Ashanti and Akan royal stools have U-shaped seats, supported on five pillars and mounted with silver or gold. Carvers dominated traditional West African wood-working: the figurative stools of the Fon and Yoruba, in particular, were developed with great plastic vigor. Most are left unfinished, but stools from Cameroon and Nigeria were sometimes completely swathed with strongly colored beadwork.

The circular or lozenge-shaped openings in early Chinese drum stools reveal their ancestry of bamboo or rattan, but this ancient form was also made in silk-upholstered straw, lacquered wood, and porcelain. By the Ming dynasty drum stools were usually hardwood, sometimes decorated with bosses and string mouldings in imitation of hide drums. The Chinese also made broad stools to accommodate cross-legged posture; these were usually flat, boxy platforms with straight or curved "cloud-rail" stretchers. Chairs were considered improper for Chinese women, who used stools instead until well into the 13th century. In India slightly taller wide stools were traditionally accompanied by foot-stools to support an indolent leg.

Joined and turned stools played a vital social role in

medieval Europe as the least favored forms; even benches were considered superior. In his own home, a peasant might have used a chair while his wife and children sat on benches or stools, but he would expect to be seated on a low stool at the local lord's hall. In late 16th-century England stools were still being sold in sets of six for dining table use. Surviving examples look severe, but cushions added comfort and glamour to seats in all but the simplest homes. Medieval stools were also pressed into service as candlestands or small tables. The triangular turned stool, a charming and economical form, remained nearly unchanged for centuries. Although banished to kitchens and private rooms in fashionable homes after about 1625, it retained favor in the Netherlands somewhat longer. Joined stools were made of planks, with board or turned legs; board legs and aprons were often notched, pierced or chip-carved for decorative effect. 16th-century joined stools could be so heavily carved that their origin as humble planking was virtually obscured.

A variant of the *sella curulis*, made with closely spaced, S-curved slats in place of the open frame, was briefly revived in Renaissance Italy, but this form had more duration as a folding chair than a stool. As furniture became more specialized, innovations were made in other forms, and the stool's importance was usurped by new types of tables and chairs. Rustic forms survived in modest surroundings, but fashionable upholstered stools generally imitated the French court's *tabourets*, with tassels, fringe and gorgeous carved gilt frames. Suites of furniture became standard in the 18th century, and included upholstered stools as appendages to sofas, easy chairs, and beds. They were considered particularly stylish perches for women occupied with needlework. Victorian upholstered hassocks and piano stools were favored showcases for embroidery and Berlin woolwork, and perfectly suited to the lush, cluttered Aesthetic interior. These confections were scorned by Arts and Crafts movement purists, who flanked their fireplaces with "Gothic"-style joined oak stools with leather seats.

Tall turned stools were used at bar counters after the 1820s, and Michael Thonet's bentwood versions became classic bar furniture soon after their introduction in mid-century. Shorter bentwood stools were advertised as office furniture. Tubular steel furniture, espoused by Le Corbusier and Marcel Breuer, was too expensive to catch on widely except in America, where steel was cheap and abundant. Tall stools of wood or steel have become standard at kitchen counters since the early modern era, and were essential elements of "rec rooms" and home bars in the post-war American home. In the 1920s, a vogue for dressing tables spurred Art Deco designs for matching stools, and the taste for exotic, "primitive" forms inspired Pierre Legrain to take one of his most celebrated designs directly from Akan and Ashanti royal stools. In contrast, Alvar Aalto's bent plywood stacking stools (c.1933) are stark expressions of modern functionalism; yet their tripod structure is archaic. The futuristic simplicity of Eero Saarinen's pedestal stool for Knoll (1956) is among the few truly original gestures made in this form.

Stoves

Ceramic

The use of ceramic stoves for heating the interiors of buildings was a common phenomenon in Central, Eastern and Northern Europe from the Middle Ages to the early 20th century. It sprang from the need to have a sustained but secure form of heating during the long bitter winters.

Ceramic stoves conform to standard construction norms. They are free standing structures which have a fireproof chamber at the bottom for fuel. The fire chamber is connected to a flue which draws off smoke and fumes. The top half of the stove is a ceramic superstructure where the warmth is stored and radiated. The construction of large stoves would always take place on the spot. Ceramic stoves vary enormously depending on the period and country in which they were built and the type of patron for whom they were made. They often became an index of status for the owner and the most elaborately decorated and painted specimens could only be afforded by the upper echelons of society. It is often these stoves that have survived.

Some of the oldest ceramic stoves date from the 15th century; several examples were made in Cologne, Germany. These stoves were covered with so called "half cylinder" tiles which had deep semi-circular recesses with the top half decorated with perforated Gothic pointed arches and foliage patterns. The deep cavities of these "half cylinder" tiles created a greater surface from which the heat could radiate than would normally be possible with flat tiles.

During the 16th century some truly magnificent stoves of up to eight feet high were made in Germany, Austria, and Switzerland. Nuremberg stoves were particularly renowned; they are characterised by the use of high relief tiles with

Stoves: ceramic stove, Swedish, 18th century

Renaissance-inspired decorations showing religious scenes, portrait medallions, and floral patterns covered with a green, brown, or yellow glaze. In Austria, Innsbruck and Kitzbühel were production centres, along with Winterthur in Switzerland. Stove tile manufacture at Winterthur was dominated for generations by the Pfau family who covered their tiles with white tin glaze on which they painted complex figurative scenes and inscriptions in blue, yellow, green, and purple. A magnificent example of their work is still in place in the former Chancellory of the Freuler Palace, Nafels, made by Hans Pfau II.

In Russia the very early stoves of the 15th century were made of unglazed red tiles with relief design. In the 16th and 17th centuries stoves featured glazed polychrome relief tiles, and in the 18th century flat painted tiles came into fashion with figurative designs painted in purple, green, and yellow. Blue-and-white stove tiles influenced by Dutch Delftware were especially popular with the Russian nobility. In the Palace of Tsarskoe Selo (now Pushkin) there is a large blue-and-white stove stretching from floor to ceiling in the corner of the sumptuous Cavaliers Dining Room where it contrasts well with the white walls covered in gold Rococo decorations. The tradition of these magnificent painted blue-and-white stoves is still carried on today by the Gzhel pottery near Moscow.

In Scandinavia tiled stoves were a standard part of the

interior decor of houses. In Denmark stove tiles were made at the 18th-century Blataarn Factory near Copenhagen which operated under the royal patronage of Christian VI. Beautiful Neo-Classical tin-glazed stoves were also made at the 18th-century Stockelsdorff factory in Schleswig Holstein consisting of a cast-iron firebox with a ceramic superstructure. In Sweden tiled stoves were a common element of the domestic interior, as we can see in the work of the late 19th century Swedish illustrator Carl Larsson. His finely detailed watercolours often show tall rectangular white stoves painted with flowers executed in pink and green.

In France there was a fashion for ceramic stoves during the reign of Louis XV. Ceramic stoves made in France were used in various royal palaces such as Versailles and in the palaces and castles of the French nobility. Although many of these have disappeared, a splendid example is still *in situ* at the Château Chambord. This is a tall rectangular stove with white tin-glazed tiles painted with purple landscapes. During the late 19th century metal stoves decorated with ceramic Art Nouveau tiles were produced in France for use in ordinary homes.

In Britain, where open fireplaces have always been the norm, the fashion for tiled stoves never caught on. German stove tiles were imported as early as the late 15th century and were used in monasteries such as Fountains Abbey, Yorkshire, where stove tiles made in Cologne have been excavated. German stove tiles of a 16th-century date have also been found in excavations in London, pointing to their use in houses of the well-to-do. In the British Museum there are fragments of green-glazed stove tiles dated 1540–45 found on the site of Henry VIII's Whitehall Palace. They seem to have been used in a room near the royal bath and are attributed to local potters active on the Surrey-Hampshire borders imitating German stove tiles. The most recent example is the large ceramic stove with Minton tiles designed by A.W.N. Pugin for the Medieval Court of the Great Exhibition of 1851.

HANS VAN LEMMEN

Iron

Iron stoves have also proved popular in Europe and North America. The principle of the stove was first found in the *laconica* (saunas) of ancient Rome, but its most important function as a highly efficient source of heat only really developed in the last 200 years. The closed stove probably originated from a covered brazier with a connecting pipe employed to draw the fumes off the fire. This, in time, became a simple iron box or Dutch Stove, with its lid raised to extend the heated surface, which developed in to the complex shaped stoves so popular in the 18th and 19th centuries. These stoves had several surface layers or chambers and a long, convoluted pipe designed to prevent the heat from escaping quickly. They were popular because they were up to four times more efficient than open fires and their heat could be directed and controlled more easily.

Before looking at the traditional "closed" stove in more detail, however, there are other examples of stoves that should not be overlooked. Medieval houses would have been heated and lit by a central open fire which was also used to cook food on but, by the 17th century, fires would have been laid in

grates or baskets, probably made of cast iron, and backed with an iron fireback or plate. In the 18th century, three iron fire-bars were added to the front, which was usually decorated, and cast-iron sides were attached to the basket and it became known as a stove-grate. From the 1750s the design of the stove-grate became more elaborate with various examples being produced from the Gothick to the Neo-Classical style. The hob-grate followed, a cast-iron stove with five bars set between two cast-iron plates; it was capped by hobs either side of the fire basket, upon which a kettle could be placed. It appeared in country houses as early as c.1720 and fitted directly into the fireplace.

Derivatives of the hob-grate were given names such as the Bath, Forrest, Pantheon or Duck's Nest grate, depending on the shape of their front. A further refinement of these was the Register grate, which controlled the flow of heat up the chimney by a sliding iron plate set in the opening. Most of these stove-grates would have been made from cast iron and many were manufactured by the Carron Company (founded in 1759), or Coalbrookdale's (established a century earlier), although polished steel was favoured in the mid 18th century by those who could afford it.

Closed iron stoves also came in many different shapes and sizes and were used in a surprisingly wide range of buildings. Abraham Buzaglo (1714–88), a stove manufacturer who had a shop on the Strand in London, advertised that his patent "warming machines" were suitable for "Churches, Noblemen's Houses, Assembly-Rooms, Coffee-Houses, Halls, Parlours, Dining rooms, Bed-Chambers, Compting Houses, Public Offices, large Shops, Hot-Houses, Green-Houses, Wine-Vaults, Ec.Ec." He also declared that his stoves were meant to please the eye as well as heat the body without burning the face or legs, and that unlike other stoves, his did not smell. The Adam brothers also designed cylindrical Neo-Classical stoves topped with urns and vases for their wealthy clients; other popular 18th-century designs were shaped like pyramids or made to resemble fluted columns. Unfortunately, since the introduction of central heating, few examples of these wonderful objects have survived: there was one in the King's Staircase at Kensington Palace, London, in the early 19th century which has since been removed, and one of Buzaglo's *Treble Tier Patent Warming Machines* can still be seen at Knole Park in Kent.

Cast iron has remained the preferred material for all kinds of stoves produced in Britain and North America to this day, although ceramic stoves were a more familiar sight in domestic interiors across northern Europe from the 17th century onwards. Certainly one of the reasons why iron stoves were favoured was their portability. For example, in the first half of the 19th century, the pioneer settlers of North America took primitive iron stoves across the country, and portable stove-cookers such as the *Doric* and the *Sultana* (c.1914), were still popular with families travelling to far-flung outposts of the British Empire in the first decades of the 20th century.

Streamlining and Moderne

The Moderne, Modernistic or Jazz Moderne was a design style which emerged during the early 1930s and endured through World War II. A mixture of Art Deco and the Modern, it appealed to mass taste and influenced the interiors of modest homes, cinemas and hotels. It began in America and was disseminated through Hollywood cinema and magazines. Streamlining was a particular part of the Moderne. It describes a way of styling products and interiors to make them look sleek and futuristic with an emphasis on horizontal lines and banding. The Moderne used new, affordable materials, such as chrome, and was easily mass-produced for the growing army of new consumers. It lacked the social conscience of Modernism and the exclusivity of Art Deco. It was the first popular style of the 20th century.

After the 1925 Exposition in Paris a new generation of French designers began to incorporate elements of Modern Movement design into their work. The Moderne designers, as they became known, upset the design establishment, and Paul Follot in particular, with their apparent disdain for the French decorative heritage. The career of Eileen Gray, for instance, demonstrates this trend. In 1920 she designed an Art Deco apartment for the milliner Suzanne Talbot in which animal-skins, a pink upholstered armchair and bronze lacquered sofa

Streamlining: industrial designer's office by Raymond Loewy and Lee Simonson, for *Contemporary American Industrial Art* exhibition, Metropolitan Museum of Art, New York, 1934

with silver-leaf decoration were carefully arranged to create an exotic atmosphere. In 1922 Gray opened Galerie Jean Desert, her Paris showroom, to sell her exclusive lacquerwork screens and hand-crafted rugs. After 1925 she began to assimilate the influence of Modernism by turning her interest to architecture rather than interior decoration and using tubular steel and glass for her furniture designs. The members of the Union des Artistes Modernes (UAM), founded in 1929, followed a similar path. Pierre Chareau, René Herbst, Robert Mallet-Stevens and Francis Jourdain adopted new materials with élan and the principles of Modernism with enthusiasm. Chareau's Maison de Verre in Paris is a key example of the transition from Art Deco to Moderne. It is constructed from a metal frame and standard, industrial glass bricks. The visual features of Modernism were adopted by such designers, rather than the revolutionary principles of the Bauhaus or Russian Constructivism.

Generous official support was supplied again by the French for avant-garde design during the 1930s. The decoration of the luxury liner *Normandie*, launched in 1935, was undertaken by France's leading decorators for the Compagnie Generale Transatlantique. The Grand Salon was decorated with a four-part mural by Jean Dupas, depicting myths of navigation, using *verre églomisé*. This involved painting and gilding the back of clear, plate glass which was then affixed to the walls. There were fountain-shaped table lights and tapestry-covered chairs. The effect of this interior and the First Class dining room was one of awesome grandeur, achieved through sheer scale – the Dining Room was 305 feet long – and the use of glossy surfaces. The travel writer Ludwig Bemelmans described the experience of being in the Grand Salon of the *Normandie* as: “a room full of silver, gold, and glass, large as a theatre, floating through the ever clean, endless ocean just outside the high windows.”

The chief source of the Moderne style and Streamlining was America. Isolated from Europe during World War I, Americans first learned of European advances in design from the 1925 Paris Exposition. In America the Mission Revival and Spanish Colonial styles were dominant. America had little confidence in her standing as a style-leader, so much so that the country did not contribute to the 1925 International Exposition, but sent over 100 delegates to glean ideas. Art Deco was then exported to America via touring exhibitions and magazine coverage, where it was enthusiastically received. The new style could be adapted to the mass production techniques which had been pioneered in America and symbolised the aspirations of the nation. As the American writers Therese and Louise Bonney argued in *A Shopping Guide to Paris* in 1929: “Where France leads the world to-day in decorative art, and centers its creations in Paris, possibly another country will lead in 1940. America should since it is here that the machine age, the inspiration for most creative effort to-day, is developing its possibilities.” It was the new breed of industrial designers who were to initiate a move away from stylistic revivalism to a machine aesthetic.

As a result of the 1929 Wall Street Crash, American manufacturers of consumer goods were compelled to stimulate new markets for their products. Design grew in significance as it came to be recognised as a marketing tool. Individual designers began to enjoy film-star status as businesses realised the

marketing potential of their touch – design sold goods. Norman Bel Geddes, Henry Dreyfuss and Walter Dorwin Teague were the three leading members of this new design profession. The style they chose to work in when creating complete interiors, cameras or refrigerators was the Moderne or Streamline. Adopting shapes developed in experiments with aerodynamics for cars and trains, the swept-back style symbolised the dynamism of contemporary American culture. The teardrop motif of streamlining was pioneered by Harley Earl in his car designs for the Chrysler Corporation during the 1930s. It blended the reflective surfaces of Art Deco, the Modern preference for new materials and an enthusiasm for machinery and progress. Because the source of Streamlining was aerodynamics, the emphasis was on the horizontal, on smooth, enveloping forms. It was widely used for the design of electrical goods for the home, for example, Loewy's Coldspot refrigerator of 1932 has aerodynamic lines. In interior design, three horizontal bands often ran around the walls, for example, Loewy's design for a designer's office, exhibited at the Contemporary American Art show at the Museum of Modern Art in 1934. Frank Lloyd Wright also used the Moderne style for the S.C. Johnson and Son Administration Building at Racine, Wisconsin of 1936–39. The huge main office is sub-divided by tapered columns which terminate in a circular pad on the ceiling. The metal furniture, also designed by Wright for the building, echoes these smooth, circular lines. Donald Deskey's interior of New York's Radio City Music Hall of 1931–32 is another key example of the Moderne. Smooth, clean lines, mirrors, chromium-plated steel and tubular aluminium furniture, veneers, Bakelite and lacquer conjure up an atmosphere of futuristic glamour, removed from the detail and revivalism of Art Deco.

The set designs for Hollywood films were also in the Moderne style, reflecting the buoyant mood of the industry. Cedric Gibbons was a leading Hollywood art director whose visit to the Paris Exposition in 1925 influenced his design for the set of *Grand Hotel* (MGM, 1932). The Moderne furniture and satin furnishings acted as a perfect backdrop for Greta Garbo. The Hollywood musical also exploited the Moderne style, particularly Busby Berkeley's *Gold Diggers of 1933* (MGM, 1933) and films starring Fred Astaire and Ginger Rogers, for example, *Top Hat* (RKO, 1934). The use of reflective surfaces, long sweeping curves and zigzag profiles were all inspired by the Moderne.

The Moderne style, as seen in the Hollywood movie, inspired British architect-designers to dispense with period detail and adopt smooth, seamless surfaces enhanced by the use of mirrors, metal, silver-foil or paint. For example, Raymond McGrath designed the interior of a Victorian mansion in Cambridge to be completely reflective. The entrance-hall floor was covered in black indurium, the walls in silver-leaf sprayed with green lacquer and the ceiling was faced in green glass. Oliver Hill's designs of the 1930s also reveal a Moderne influence, with the entrance hall of Gayfere House, London consisting almost entirely of mirror-glass. Concealed electric lighting was also an important part of the Moderne interior. Oliver Percy Bernard's foyer for the Strand Palace Hotel, London of 1930 used an illuminated doorway, balustrade and columns to dazzle the visitor. The growth in the domestic consumption of electricity and electrical goods led to

a boom in manufacturing. New factories in the Moderne style were erected on Western Avenue leading out of London. The Hoover factory by Thomas, Wallis, Gilbert and Partners of 1932 is a symmetrical building adorned with brightly coloured, Moderne ornament including a coloured glass sunburst.

This was a decorative device to be seen gracing the windows and gates of many of the four million new private homes built in Britain from 1919 to 1939. Such homes were modest, two or three bedroomed dwellings furnished with over-upholstered three-piece-suites and Moderne fireplaces. The glazed china cabinet was another key feature of the new living room, used to display the best tea service. The Moderne ceramics produced by Clarice Cliff and Susie Cooper enjoyed great popularity. Such a suburban lounge can be seen at the Geffrye Museum, London and the Castle Museum, York.

By the end of the 1930s America enjoyed a new confidence in its indigenous design style. The break with Paris as style leader had taken place, and New York emerged as leader of the design avant-garde in the post-war era.

Stuart, James 1713-1788

British architect, painter and designer

James Stuart, or "Athenian" Stuart as he was also known, played a key role in the development of Neo-Classicism in the third quarter of the 18th century. Active as a draughtsman, architect and designer of furnishings and interiors, his career paralleled, and to some extent rivalled that of Robert Adam, and it was only perhaps professional indolence that prevented Stuart from taking the lead in the formation of a new fashionably Greek style of architecture and decoration in England. His architectural output was comparatively small, but his work included the temple at Hagley (1758) which was the earliest revived Greek Doric building in Europe. And his publications included the celebrated *Antiquities of Athens*, published with Nicholas Revett (1720-1804), which was hugely influential both in England and on the Continent and which continued to serve as a Neo-Classical sourcebook well into the 19th century. But it is for his work on interiors that he is arguably best-known today. His decorations and furniture were designed in a pioneering and severe Greek style and his most famous commission, Spencer House, London, was the first Neo-Classical ensemble in Europe.

Stuart was born in London in 1713 and worked first for the fan-painter Lewis Goupy who had accompanied Lord Burlington on his grand tour of 1714 to 1715. Goupy not only encouraged Stuart in his studies of mathematics, geometry, drawing and painting but also guided him in his interest in Classical antiquity. Having taught himself Latin and Greek, in 1742 Stuart travelled on foot to Rome. In 1748 he accompanied the painter Gavin Hamilton, the architect Matthew Brettingham, and Revett to Herculaneum and Pompeii, and in 1751 he and Revett set off for Greece on an expedition financed by the Society of Dilettanti to gather material for the publication of "an Accurate Description of the Antiquities of Athens". On arriving in Athens, the two were welcomed by Sir James Porter, the ambassador in Constantinople who was also a member of the Dilettanti and who facilitated their study of the ancient monuments. In 1753, Stuart went to Constantinople, and in 1754, after having met up with Revett in Salonika to visit the Greek islands, they returned to England to prepare for the publication of the materials they had accumulated during their years abroad.

The publication was to consist of four volumes: the first two would cover the monuments in Athens, the third the buildings on the Acropolis, and the fourth would be devoted to the other remains in Attica. After various delays, the first volume, entitled *The Antiquities of Athens*, appeared in 1762 and was immediately acknowledged to be a remarkable example of architectural archaeology. But, lacking the famous buildings of the Acropolis, it did little to encourage the revival of Greek architecture in England; this had to wait for the second volume, published by Stuart's widow, more than twenty years later in 1789. A third volume, for which Stuart had left the

completed drawings, was edited by Willey Revely and appeared in 1795; in 1816 a fourth volume was issued by Josiah Taylor and in 1830 a fifth volume was added by C.R. Cockerell and others. A French edition of the first volume was published in 1793, and many other editions of all or part of the series were issued: in French in 1808–12 and again in 1881, in German in 1829–33, in Italian in 1832–44, and in England in 1850–51.

Stuart's contacts in the Society of Dilettanti provided him with several important patrons, and by 1760 he had established himself as a leading figure in the study of antiquities and the promotion of the Greek style. While few of his buildings – with the exception of the temples he designed at Hagley (1758) and Shugborough (1760s) – can be regarded as particularly important, his designs for decorations and furniture at Kedleston and Spencer House had a significant impact on English taste.

Stuart was consulted by Nathaniel Curzon (later Lord Scasdale) about the design of interiors at Kedleston, Derbyshire, in which to display its owner's collection of paintings and sculpture c.1757. In the end, Stuart was ousted in this commission by Robert Adam who completed the house in 1760–65, but Stuart's drawings for the Great Saloon and the dining room survive and illustrate his interest in archaeologically inspired decoration. The design for the Great Saloon includes a massive, sober chimneypiece decorated with lion masks and wreaths derived from those on the Choragic Monument in Athens, painted decoration and free-standing Greek tripods.

Stuart's work for Lord Spencer at Spencer House, London, executed between 1756 and 1766 and now newly restored, was even more impressive. The house was designed by John Vardy, a disciple of William Kent, and Stuart was called in to enliven the interiors. His suite of rooms on the first floor has been described as "the most magnificent domestic interiors of 18th century London, unsurpassed for the dazzling quality of the fittings and the unity of architecture, furniture and decoration" (Watkin, 1982). The upper landing contains many explicitly Greek references such as pilasters with Ionic capitals and garlands hung between them similar to those in a frieze taken from the Temple of Ilyssus that had been illustrated in a volume of the *Antiquities*. The Great Room, or Ballroom, contained a fine collection of paintings by Guercino, Sacchi, Salvator Rosa and Guido Reni, whose gilt frames were carved to match the door and ceiling surrounds, and which were hung on a red damask background. It also had a magnificent green, white and gold coffered ceiling containing three shallow domes. Stuart's masterpiece is the Painted Room where the decoration harks back to Italianate influences. Much of the colorful painted wall decoration relies on ancient grotesque or arabesque ornament which had been revived in Renaissance Italy by Raphael, Vasari, Giovanni da Udine and their followers. This is subordinated within a strong architectural framework that is established on the north wall by pilasters defining three bays that are matched by a screen of Corinthian columns in front of the bow-shaped apse at the south end of the room. Classical allusions are also much in evidence. A painted frieze on the chimneypiece is derived from the so-called *Aldobrandini Wedding* in the Vatican Museum, and images of Venus and Hymen over the doors refer to the recent marriage of Lord and

Lady Spencer. The screen is based on the portico of the Temple of Antoninus and Faustina in Rome, while the doorcase and mirrors in the apse have friezes inspired by those in the colonnade of the Incartada at Salonika. The painted ceiling contains a central compartment representing the signs of the zodiac and eight other compartments featuring paintings of female dancers or floral and foliate wreaths.

Stuart also designed a magnificent suite of Neo-Classical furniture for this room: two torchères, four mirrors with carved and gilded frames, four sofas and six massive arm chairs. The torchères, which were nearly seven feet high, were once again derived from the Choragic Monument, and were very similar to examples Stuart had designed for Kedleston; they were repeated for the Marquess of Rockingham's Wentworth House, c.1760. They had tripod stands incorporating panels painted with Pompeian winged figures of Victory that were surmounted by winged griffins. The sofas had ends representing winged lions – a feature that was to become quite commonplace in Empire and Regency furniture of the early 19th century – and were indebted to antique examples that Stuart had seen in Italy. All the furnishings were designed for particular parts of the room: the torchères, for example, stood between the Corinthian columns, while two of the sofas stood under the windows in the apse and the other two opposite the chimneypiece. Each piece was an essay in the early Greek Revival style and paralleled developments in advanced French Neo-Classical taste and particularly work by *Goût Grec* designers such as Le Lorrain, Neufforge, and later J.C. Delafosse.

Few of Stuart's other commissions were on a scale similar to that of Spencer House, and during the 1760s the massiveness of his Franco-Greek style was replaced with a more elegant and decorative Adamesque manner, as is evident in his work at Holderness House and Lichfield House, both in London. His architectural career clearly suffered from criticisms levelled at his work by contemporaries such as William Chambers and Robert Adam and he built little after the mid-1760s. Nevertheless, Stuart continued to produce designs for manufacturers like Wedgwood and Matthew Boulton and antique motifs such as fluting, paterae, griffins, guilloche and anthemion that were popularised in his publications became a standard part of the Neo-Classical repertoire.

Biography

Born in London, 1713. Studied mathematics, geometry and anatomy, and taught himself Greek and Latin. Married twice. Worked first as a fan painter for Lewis Goupy. Travelled to Rome in 1742, and worked as a guide for English visitors; visited Naples with the painter Gavin Hamilton and the architects Matthew Brettingham and Nicholas Revett in 1748; went to Venice and Greece with Revett, 1750–51; both elected members of the Society of Dilettanti, 1751; travelled to Constantinople, 1753; returned to England, 1755. Published the first volume of *The Antiquities of Athens* in 1762; subsequent volumes appeared posthumously in 1789, 1795 and 1816. Worked on a number of architectural projects and interiors in the late 1750s and 1760s. Made a fellow of the Royal Society, and the Society of Antiquaries of London; surveyor of Greenwich Hospital, 1758; painter to the Society of Dilettanti, 1763 (replaced by Joshua Reynolds, 1768). Died in London, 2 February 1788.

Selected Works

Manuscript material relating to *The Antiquities of Athens* and a manuscript memoir of Stuart, written by his son, entitled *James Stuart surnamed Athenian*, are in the British Museum. Examples of Stuart's decorative designs and his designs for architecture are in the British Museum and the Drawings Collection of the Royal Institute of British Architects, London. An album of drawings relating to Holderness House and Lichfield House is in the Prints and Drawings Department of the Victoria and Albert Museum, London; drawings for Stuart's unexecuted work at Kedleston are in the Archive, Kedleston, Derbyshire. Examples of his furniture can be seen at Spencer House, Kenwood, and the Victoria and Albert Museum, London, and also at Althorp, Northamptonshire, to which several chimneypieces and doors from Spencer House were removed during the 1920s.

Interiors

- 1755 Wentworth Woodhouse, Yorkshire (decorations in the Drawing Room and Marble Saloon): 2nd Marquess of Rockingham
- 1756–66 Spencer House, St. James's Place, London (decorations and furnishings including the Painted Room, Ballroom and Rubens Room): 1st Earl Spencer
- c.1757 Kedleston, Derbyshire (unexecuted designs for the Great Saloon and Dining Room): Nathaniel Curzon
- c.1758 Wimbledon House, Surrey (decorations including the Hall and Dining Room): 1st Earl Spencer
- 1758–59 Hagley Hall, near Stourbridge, West Midlands (temple, and drawing room ceiling)
- 1760–65 Holderness (later Londonderry) House, Park Lane, London (interiors including the north drawing room, centre drawing room and boudoir): 4th Earl of Holderness
- 1764–66 Lichfield House, St. James's Square, London (interior decoration including the drawing room): Thomas Anson
- 1764–70 Shugborough, Staffordshire (interior decoration, and park buildings): Thomas Anson
- 1775–82 Montagu (later Portman) House, Portman Square, London (building and interiors): Mrs. Montagu

Designs for vases and silverwork executed by Josiah Wedgwood and Matthew Boulton.

Stuck, Franz von 1863–1928

German painter, sculptor, architect and designer

Franz von Stuck was born 23 February 1863 in Tettenweiss, Lower Bavaria, the son of a miller. He died rich and laden with honours on 30 August 1928 in Munich having been one of the most influential figures in the artistic life of that city for nearly forty years. Stuck was variously described as a remarkable dilettante or a "prince of art", and the multiplicity of his talents included drawing, painting, sculpture, design and architecture. As such he typified the many-faceted artist-designer of the Art Nouveau period even though his work itself was essentially in the historicist tradition.

Influenced by the illustrated magazines and newspapers to which his mother subscribed, at an early age he covered the floorboards, doors and walls of his home with white chalk or crayon drawings, extending his range of subjects to include caricatures of the villagers and earning the sobriquet "The Painter" by the age of six. On completing his secondary education at the Royal High School in Passau, he enrolled in 1878 at the Royal College of Arts and Crafts (Kunstgewerbeschule) in Munich, moving in 1881 to the Royal Academy of Fine Arts whence he graduated in 1885.

While at college he established a reputation as a caricaturist working for the Munich magazine *Fliegende Blätter* (Broadsheets) to which he continued to contribute until 1892. As a draughtsman he produced illustrations for the Viennese publishers Gerlach and Schenk for two volumes of designs – *Allegorien und Embleme*, 1882 (Allegories and Emblems) and *Karten und Vignetten*, 1886 (Cards and Vignettes) – as well as drawings for *Die Zwölfe Monate* (The Twelve Months) published by Gustav Weise, Stuttgart, in 1888. An early poster design, for the Art Exhibition in the Munich Crystal Palace in 1889, depicted a naked, winged male figure offering a laurel wreath and a sprig of palm to the female personification of Painting seated on a classical throne, all against a thickly painted gold background. The form and content of this design

Stuck: south wall of Music Room, Villa Stuck, 1897–98

illustrates the Neo-Classical vocabulary which was to be the basis of his success as a painter.

In 1889 Stuck also began painting in oils, winning the second Gold Medal at the Munich exhibition with a cash prize of 60,000 marks for *The Guardian of Paradise*. He rejected the naturalism of both the contemporary historical school and the so-called "ledernhosen" school who specialised in immensely popular, sentimental depictions of "young peasants, agricultural workers and ordinary boys". Instead, Stuck favoured themes influenced by Symbolist writers which concerned the mind and the soul, and whose subject-matter was frequently highly charged with erotic overtones, so much so that some critics have described them as bordering on the pornographic. Works of this kind include *Sin* (1892), *Vice* (1894), *The Kiss of the Sphinx* (1895), *Wounded Amazon* (1904) and *Salome* (1906), all of which contain a nude, or nearly nude, predatory female figure as the dominant feature. In 1892, dissatisfied with the conservative Munich Art Society, Stuck co-founded the Munich Secession. He designed the poster for their first exhibition in 1893; it depicts the profile of Pallas Athene drawn as if in mosaic and it remained the symbol of the organisation until the 1930s.

Stuck's attention to the framing of his paintings is significant in the development of his ideas of total design. Each frame was designed specifically to enhance the painting it contained. They were frequently multi-panelled, with the size, colour or shape of the panels emphasizing the main features of the painting. On occasion the frames simulate a wall or a small classical temple in which the painting sits as if on an altar. The title of the painting is also often featured on the frame. The role that Stuck's paintings played as decorative features within a total interior design is well illustrated in the Villa Stuck which was constructed in 1897–98.

In 1895 Stuck had been appointed professor at the Royal Academy of Fine Arts, Munich (where his pupils would later include Paul Klee, Wassily Kandinsky and Josef Albers), while his reputation as a painter was increasing. The following year saw the birth of his daughter Mary, by his mistress Anna Maria Brandmeier. Mary's godmother was an American widow whom Stuck married in the following year. He decided that he should now have a home suited to his new domestic and professional status. The home and studio was to be a total work of art – a *gesamtkunstwerk* – and would serve both as an expression of his abilities as architect, interior designer and decorator, and as a demonstration of his theory that there should be no boundaries between the fine and applied arts.

The design, and its execution by the Munich firm of Heilmann and Littman took only two years. The Villa was built on the fashionable Prinzregentenstrasse on the heights above the River Isar and is probably the finest achievement of the historicist movement, combining architectural and decorative influences from Greek and Roman antiquity, Byzantium, the Orient and European High Renaissance. The street façade is divided both horizontally and vertically into three sections – the central section being recessed between two wings. Extending forward from this section is a Doric portico which in turn provides a balcony to the studio on the first floor. Within the portico the entrance to the house is through massive bronze doors to a vestibule decorated with antique reliefs and sculptures and from which there is direct access to the recep-

tion room and the music room. The latter epitomizes Stuck's approach to interior design with its Pompeian-style painted walls in greens, browns, reds and black. The north wall represents the world of Song and is dominated by a statue of Orpheus, while the south wall celebrates the world of Dance and has a painted representation of Pan and a painted plaster relief of two classically-inspired veil-dancers. The ceiling, painted in a deep blue, is decorated with golden stars, the signs of the zodiac and a flashing comet. From the reception room a library corridor designed in the High Renaissance style leads to a boudoir decorated with scenes from Greek mythology. Also on the ground floor are a dining room, overlooking the garden, and a smoking room.

Apart from two bedrooms and a bathroom, the upper floor is given over almost entirely to a vast studio where walls and ceiling are again covered in classically-inspired decoration and *trompe-l'oeil* painting. The main feature of the room is a classical Altar to Art intended for the display of Stuck's major works, notably his painting *Sin* in its Doric gilt frame. This feature also doubles as a screen behind which Stuck's models could change!

The Villa Stuck is not only a supreme work of art in itself but provided a suitable stage on which Stuck and his family could live their lives. The furniture throughout the house mixes both Classical and Egyptian elements, often in painted wood and leather. It was awarded a gold medal when it was exhibited at the Paris Exhibition of 1900.

Stuck continued to paint throughout his life though he rejected the new art movements of the 20th century by constantly returning to the themes of his earliest career. He was ennobled as a Knight Grand Cross of the Order of Merit of the Bavarian Crown (adding "von" to his name) in 1906. In 1914 he extended the villa with the addition of a larger studio with better facilities for sculpture. Further recognition of his achievements included membership of the Academy of Arts, Vienna, the Royal Academy, Stockholm, Freedom of the University of Munich and, in the last year of his life, a Doctorate and the Directorship of the College of Technology of Munich.

The Villa Stuck opened as a museum in 1968 and in 1992 was transferred to the ownership of the city of Munich.

BRIAN J. R. BLENCH

Biography

Born in Tettenweiss, Lower Bavaria, 23 February 1863. Studied at the Kunstgewerbeschule, Munich, 1878–81, and the Akademie, Munich, 1881–85. Married in 1896; one daughter, Mary (b. 1895), by Anna Maria Brandmeier. Worked as a caricaturist and illustrator from c. 1882; active as a painter from 1889. Co-founder, Munich Secession, 1892. Appointed professor, Akademie, Munich, 1895. Designed furniture, painting, sculpture, interiors and architecture for his Villa Stuck, 1897–98. Gold Medal, Exposition Universelle, Paris, 1900. Made a Knight of the Bavarian Order of Merit, 1906. Member of the Akademie, Vienna, and the Royal Academy, Stockholm. Awarded a Doctorate and Directorship, College of Technology, Munich, 1928. Died in Munich, 30 August 1928.

Selected Works

Examples of Stuck's furniture, paintings, sculpture and decoration are preserved in the Villa Stuck, Munich, which is now run as a museum.

1897–98 Villa Stuck, Prinzregentenstrasse 60, Munich (building, interiors, decoration and furniture): Franz von Stuck

Studioli

Studiolo, a diminutive of *studio*, principally denotes a small room within the Renaissance palace, set apart ostensibly for the purpose of private study, and decorated in an appropriate style. The term first gained currency in Mantua with Isabella d'Este, who was responsible for one of the most famous examples of the genre. In Florence, however, studiolo was used more widely to refer to a piece of furniture, usually a cupboard made to contain books and precious objects, sometimes with a writing desk attached.

This secondary meaning highlights an important aspect of the function of the studiolo, that of display. Collecting was a widespread passion at Renaissance courts, and although nominally a place reserved for intellectual activity, the main purpose of the studiolo was usually to house its owner's collection of rare artistic and natural objects.

The origins of the studiolo may be traced in medieval ecclesiastical collections, and in the études of 14th-century French palaces. According to an inventory of 1402, the library of Jean, Duc de Berry, at Mehun housed a collection comprising some 3,000 items. 700 of these were paintings, but the collection also included objects of such bizarre curiosity value as a unicorn's horn, the engagement ring of St. Joseph, and an embalmed elephant.

The return of the papal court to Rome may have aided the establishment of the studiolo as an Italian phenomenon. Pope

Benedict XII is recorded as having a *studium* in the palace at Avignon, and one of the earliest recorded Italian studioli was that of Nicholas V in the Vatican, decorated with intarsia panelling and paintings by Fra Angelico and his school. Another major influence was the German tradition of *Kunst und Wunderkammern*, with collections such as that of Margaret of Austria, visited by Albrecht Dürer in 1521.

It is perhaps not surprising that studioli gained most popularity in provincial courts such as Ferrara, where the cultural climate was strongly influenced by Northern Europe. There were, however, a number of examples of the genre in Florence, although there the preferred term for a small study was a *scrittoio* or *studietto*. Lorenzo de' Medici's *scrittoio*, according to the inventory of 1492, contained collections of antique gems and vases, books and maps, as well as small paintings and sculpture.

According to the great Renaissance theorist and architect Leon Battista Alberti, the ideal location for a studiolo should be a small room with few windows to ensure privacy and warmth during the winter months. Studioli were usually placed well within the outer walls of the palazzo, frequently in odd, irregularly-shaped spaces. Decorative intarsia panelling enhanced the closet-like effect; but access to a view was also considered important, since contemplation of nature was required as an aid to intellectual activity. As their decoration consisted to a large extent of portable objects, most studioli were relatively ephemeral and could be dismantled and reassembled in different locations.

Choosing works of art for the interior of the studiolo was an important consideration for Renaissance patrons, as it was necessary to place rare objects within a decorative scheme designed to reflect and enhance their beauty and meaning. The most popular solution was a specialized programme, devised by a classical scholar, which included some mythological, symbolic or representative depiction of activities suggested by the environment. One of the first examples of such a collaboration between patron and adviser is recorded in a letter from Guarino da Verona to Leonello d'Este, dated 1447, which contains a programme for the decoration of the latter's studiolo at Belfiore with depictions of the Muses.

For his studiolo at the palace at Urbino (after 1477), Federigo da Montefeltro chose to juxtapose portraits of famous classical and medieval thinkers with contemporary intellectuals, such as his former tutor, the mathematician Vittorino da Feltre. The decoration in this room also includes fine examples of *trompe-l'oeil* intarsia (small pieces of stained or shaded wood set into a solid background) panelling representing fictive shelves and cupboards whose doors appear half-open to allow a glimpse of the heterogeneous collection of objects, such as amphorae, books and musical instruments, housed within. In the studiolo at Gubbio figures, including Federigo himself, were depicted kneeling before personifications of the Liberal Arts. Personal and allegorical elements were thus combined in a celebration of traditional and humanist learning.

Isabella d'Este began formulating plans for a studiolo soon after her arrival in Mantua as the bride of Francesco Gonzaga in 1490. She was a keen patron of contemporary art – she possessed works by Mantegna, Perugino and Lorenzo Costa, among others – and, by her own admission, was an “insa-

Studiolo of Francesco I de' Medici, Palazzo Vecchio, Florence, 1570

tiabile" collector of classical art objects. Her first suite of rooms was on the first floor of the Castello di San Giorgio, near the Camera degli Sposi; the small room designated as the studiolo was situated above a cavernous, barrel-vaulted space known as the *grotta*. Luca Liombeni was commissioned to paint a frieze of *imprese* and decorate the insides of the display cupboards; maiolica tiles were ordered from Pesaro for the floor. By 1492, the decoration of the studiolo was almost finished, and by 1497, the first of two paintings commissioned from Mantegna installed. Meanwhile, the *grotta* took shape as a location to house the collection of antiquities; its wooden ceiling was decorated with a series of Isabella's personal devices. In 1519, with the death of Francesco Gonzaga, their son Federico took over Isabella's apartments, and she recreated her studiolo and *grotta* on the ground floor of the Corte Vecchia.

Isabella d'Este was familiar with studioli such as those of Federigo da Montefeltro; she visited the palaces of Urbino and Gubbio during a pilgrimage in 1494. However, in the decoration of her own apartments she shifted the emphasis away from the intellectual life and the portrayal of celebrated men of letters, towards a more internalized programme of personal mythology. Elements of interior design combined with carefully disposed objects and allegorical paintings to suggest themes such as the virtuous power of music and the arts, and the recasting of Isabella herself as the tenth Muse. This kind of approach became typical of many later studioli. Francesco I de' Medici's studiolo in the Palazzo Vecchio, begun in 1570, represents a definite movement away from the celebration of humanist ideals of learning, in favour of an iconography reflecting the patron's obsession with the marvels of artifice.

How much actual intellectual activity ever went on in the studiolo is a matter for debate – Federigo da Montefeltro decorated his walls at Urbino with *trompe-l'oeil* representations of scientific and musical instruments rather than the objects themselves – but with Francesco I the studiolo becomes a dazzling example of the splendour of art marking a return to the *wunderkammer* tradition. Although the reliquaries, ivories, and figures of saints coveted by medieval princes and clerics were replaced in Renaissance Italy by statuettes, medals, and cameos in the new classically-inspired taste, the principles behind their collection and display remained largely the same.

Selected Collections

The majority of Renaissance Studioli have been dismantled or destroyed. Elements from Isabella d'Este's studiolo in the Palazzo Ducale, Mantua, are preserved in the Corte Vecchia. Federigo da Montefeltro's studiolo survives *in situ* at the Palazzo Ducale, Urbino; the intarsia panelling and ceiling of the studiolo at Gubbio are now in the Metropolitan Museum of Art, New York.

Style Troubadour

"Style Troubadour" was the term used to describe the early phase of the Gothic Revival in France. Inspired by the chivalric literature and historical sources from the late Middle Ages and the 16th century, the style flourished from the beginning of the 19th century until about 1840 and encompassed painting, literature, theatre and even dress as well as furniture and decoration. In many respects it was comparable to the romantic interest in the Middle Ages evident in England and Germany at around the same time, but its appeal was not as widespread and its application was not as commercial as in other countries. Instead, it coexisted with the more prevalent classical styles that dominated decorative arts production during the reigns of Napoleon I (1804–15), Charles X (1824–30) and Louis Philippe (1830–48).

Despite isolated examples – Louis XV had purchased several Gothic *objets d'art*, and Marie-Antoinette had commissioned Gothic chairs for her private apartment at Versailles – French interest in the Middle Ages emerged somewhat later than in other parts of Europe. Unlike in England for instance, there was no strong tradition of antiquarian collecting or scholarship and the political upheavals of the Revolution resulted in the wholesale destruction and looting of many ancient châteaux and monuments. Moreover, during the period immediately following the Napoleonic Wars, a flourishing trade in stolen or confiscated antiquities grew up and vast numbers of ancient relics, architectural fragments and furnishings were plundered, particularly by English dealers, to be sold to wealthy collectors abroad. The disappearance of so many national treasures eventually prompted official moves to halt the desecration of the country's heritage and various govern-

Style Troubadour: boudoir, French, c.1836; watercolour

ment bodies were set up in the early years of the 19th century systematically to list and document French monuments.

A powerful incentive in the more sympathetic appreciation of medieval art and architecture was provided by the public exhibition of a few important collections in the late 18th and early 19th centuries. The most notable of these was the Musée des Monuments Français created by Alexandre Lenoir in 1791. Although not himself a medieval scholar, Lenoir had assembled a wide range of medieval and Renaissance antiquities from buildings confiscated during the Revolution and which he displayed in the old Convent des Petits Augustins in the grounds of the Ecole des Beaux-Arts in Paris. The arrangement of these objects was highly theatrical and "a whole generation of French antiquarians and collectors had their eyes opened to the picturesque effect that could be created by displaying medieval antiquities together" (Wainwright, 1989). The museum's most acclaimed relic was Lenoir's pastiche "tomb" for the 12th-century lovers Abelard and Héloïse (today in the Père Lachaise cemetery) which, like the collection as a whole, was designed to evoke the glories of France's chivalric past.

Another important early collector was Alexandre Du Sommerard (1779–1842) who created a series of intensely atmospheric medieval interiors in the 1820s in his house in the rue de Menars. Later, his collection was moved to the more authentically medieval setting of the Hôtel du Cluny which he rented from 1832 and which was also opened to the public. Like many collectors of this period, Sommerard was concerned less with presenting pieces for their artistic value than with evoking the historical associations of the Middle Ages, and his interiors were crammed with a mixture of genuine antiquities

and period props: the latter included many suits of armour and a dummy figure of a monk. But, like Lenoir's Musée des Monuments Français, the Hôtel de Cluny attracted numerous visitors, particularly painters, writers and wealthy French and English patrons, "and became one of the acknowledged centres of a new cult of the Middle Ages among the Romantics" in the second quarter of the 19th century (Wainwright, 1989). Sommerard himself also published a five-volume catalogue of his collection, *Les Arts du Moyen Age* (1828–46), and when he died the Hôtel de Cluny and its contents were acquired by the French government as a museum.

Settings such as these did much to set the tone for the development of the Style Troubadour which involved a romantic as opposed to archaeological understanding of the Middle Ages and which was essentially expressive of sentimental attitudes to the past. As with other styles fostered by the early Romantic Movement, form and idea combined to produce pastiche styles based on literary and philosophical thought. The Style Troubadour's market was restricted to the literary avant-garde and the aristocracy, whose influence on the arts reasserted itself under the Restoration (1815–30) – the style's zenith. The restored monarchy and its royalist sympathizers required an artistic program glorifying its continuity as well as a superior level of quality associated with that of the Ancien Régime. Made for an exclusive market, Style Troubadour production was limited in quantity and high in quality.

The Style Troubadour's literary incentive came from the enormous success of such publications as François René de Chateaubriand's *Le Génie du Christianisme* (1802). Contemporaneously, Sir Walter Scott's picturesque *Waverley* novels and historical poems also had a huge French following. Les Jeunes France, a literary and artistic group active in the early 1830s, included members such as Gérard du Nerval and Théophile Gautier. Its champion was the young Victor Hugo, whose romantic and chivalric historical drama of 1830, *Hernani*, upstaged the weighty classical tradition of the Comédie Française. Les Jeunes France expounded exaggerated Romantic theories while affecting medievalizing costumes and dress.

Within the decorative arts, the Style Troubadour principally encompassed small, anachronistic objects such as clocks, glassware, and ceramics – designed in an architecturally-inspired style known as *à la cathédrale* – as well as textiles, wallpaper and furniture. The main concern with most of these objects was the evocative use of Gothic decoration and ornament as opposed to the revival of medieval forms, and designs in the Style Troubadour largely comprised a fanciful blend of neo-Gothic elements including Gothic tracery, pointed arches, crockets, finials, pairs of spiral columns and heraldic and foliate forms. In furniture, the preference was for exotic, dark woods, such as mahogany and ebony which aped the appearance of older prototypes, in place of the blond tones characteristic of Charles X furniture. P.A. Bellangé executed a suite of furniture in polychrome ebony for the Countess de Cayla's pavilion at St. Ouen and noteworthy examples by German cabinet-makers working in France – Charles-François Berg and Guillaume Grohé – featured prominently in the Exposition Générale des Produits de l'Industrie Française of 1834.

Wallpapers featuring *trompe-l'oeil* Gothic architecture and statues in niches, and ancient ruins, often printed in grisaille on

brightly coloured grounds, were produced by many well-known manufacturers such as Zuber and Leroy. On the whole, however, the style was best-suited to the production of small items such as clocks, drinking vessels, tableware and inkpots, cast or modelled in the form of ancient relics and copiously decorated with medieval ornament. Sèvres produced several dinner services with medieval themes in the 1830s including the *Service de la Chevalerie* designed by Joseph Vigné (1822) and a service based on that of Du Geusclin by Pierre-Nicolas-Nolasque Bergeret (1835). The Style Troubadour's obvious religious associations also attracted craftsmen such as Jean-Charles Cahier (1772–after 1849), who specialized in ecclesiastical silver. Many such accessories were sold at the Petit Dunkerque, a Parisian bazaar that specialized in the Gothic style.

French romances provided designers with a useful source of inspiration, but a more important point of reference was the many pattern books, the publication of which had been growing in popularity since the beginning of the 19th century and reached its peak in the 1830s. One of the best-known publications for the Style Troubadour was Aimé Chenavard's *Album de l'ornemaniste* (1836) which contained 72 plates illustrating designs for furniture, textiles, glass, metalwork and porcelain mainly in the Gothic and Renaissance styles. Chenavard also collaborated with Achille Mascart in the complete redecoration of the chapel at Eu in the Gothic style. Another useful source of neo-Gothic models appeared in Jacob Petit's *Recueil de Mobilier* (1831). Petit's plates illustrate a huge variety of objects – from baths and lights to chimney-pieces and chairs. Each of these was represented in both the Classical and the Gothic styles, demonstrating that the Style Troubadour was perceived as simply one among a repertoire of decorative styles that could be applied to the same basic form.

More plentiful than decorative arts examples, Style Troubadour paintings help to establish a context for the style. The type had a romantic subject matter depicted in a small, cabinet-size format and painted in a rich, deep palette. The paintings' enamel-like appearance was meticulously detailed, with medievalizing stylistic devices such as the high-rising perspective found in manuscripts and ivories. The multi-faceted Jean Auguste Dominique Ingres (1780–1867) was the Troubadour painter par excellence. His *Paolo and Francesca*, painted in Rome in 1819, narrates an anecdote from the *Divine Comedy* complete with medieval trappings. The painting's overall effect is that of viewing an enlarged manuscript illumination. The fashionable Josephine Bonaparte (1763–1814) assembled a collection of Troubadour paintings.

Several Paris *hôtels particuliers* were erected from the 1780s that incorporated related neo-Gothic modes of decoration. The Duc du Berry, a notorious casino-owner who had plotted the rise of Mme. de Pompadour, constructed an exterior gallery in the Gothic style at his château at Levignac. Du Berry's wife was one of the foremost propagandists of the Style Troubadour and created several medieval-style interiors incorporating antique and neo-Gothic furniture. The Empress Josephine ordered the grand gallery of her country house of Malmaison constructed in a Gothic style (1805); this was destroyed in renovations shortly thereafter. And Princess Marie d'Orléans, who was also

a talented painter, decorated a room in the Tuileries that she used as her studio in a "style gothique sévère". A painting of 1842 by Prosper Lafaye shows her standing at a medieval lectern examining an illuminated manuscript in an interior whose sombre, dark wood Renaissance furniture, carved and painted ceiling, rich hangings and jewel-like stained-glass window, were highly theatrical and intensely romantic, and echoed the settings to be found in contemporary Style Troubadour paintings.

The Style Troubadour also had direct consequences in England. The architect and designer A.W.N. Pugin (1812–52) inherited Troubadour tendencies from his émigré draughtsman father, and his early refurbishment of Windsor Castle (1826–30) includes many items of furniture designed in a decorative Gothic Revival style. He subsequently repudiated this work as based on false principles and developed a more authentic Gothic style.

When the literary focus of the Romantic movement moved away from the age of chivalry, the Style Troubadour also declined. And by the Paris Exposition of 1839, the Renaissance had supplanted Gothic as the favored historical source.

Süe et Mare (Louis Süe 1875–1968 and André Mare 1885–1932)

French designers and decorators

The name Süe et Mare refers to the collaboration between the architect-designers Louis Süe and André Mare which was formally cemented with the establishment of the Parisian decorating firm La Compagnie des Arts Français in 1919. This firm provided a complete decorating service and employed the talents of many of the leading avant-garde designers and artists of the time, including Paul Véra, Richard Desvallières, Charles Dufresne, Boutet de Monvel, André Marty, Maurice Marinot, Marie Laurencin, André Derain and Raoul Dufy. It produced all types of household furnishings; much of the work was inspired by the style of the Louis-Philippe period combined with strong Art Deco overtones.

André Mare was born in Argentan in 1887. He studied painting at the Académie Julian in Paris and exhibited at the Salon d'Automne and the Salon des Indépendants in 1903–04. By 1910 his exhibits had begun to reveal an increasing interest in the decorative arts and included bookbindings, furniture and complete room ensembles. A particularly noteworthy commission was the set of radical Cubist furniture designs produced for Raymond Duchamp-Villon's *Maison Cubiste* at the 1912 Salon d'Automne. Mare's association with Süe began c.1912 but their relationship was not formalised until after World War I.

Louis Süe was born in Bordeaux in 1875. He originally trained to be a doctor but fairly quickly abandoned this ambition in favour of a profession in the arts. He moved to Paris in 1895 and enrolled at the Ecole Nationale des Beaux-Arts where he graduated in 1901. He began his career as a painter and, like Mare, he exhibited work at the Salon d'Automne and the Salon des Indépendants. From 1905, however, he was also working as an architect and was involved in interior decoration and furniture design. His early commissions included a row of houses in the rue Cassini, Paris, which he designed with a fellow architect, Paul Huillard (1875–1966) in 1905. In 1910, Süe formed an association with the couturier Paul Poiret. He visited Austria at Poiret's request to study contemporary Austrian design and he also decorated Poiret's houseboat and his residence on the avenue d'Antin. In 1912, inspired by Poiret's *Atelier Martine*, Süe established his own decorating firm on the rue de Courcelles, called the *Atelier Français*, for which he designed furniture, textiles and ceramics. After the war Süe and Mare formed the *Belle France* at 22 avenue Friedland as a prelude to their more successful and long-lasting *Compagnie des Arts Français* established at 116 Faubourg Saint Honoré. Architectural and decorative commissions quickly followed, including that for the cenotaph in the *Arc de Triomphe* (1919).

The firm produced a wide range of furnishings, including clocks, ceramics, lamps, textiles, wallpapers, carpets and silverware as well as furniture. The furniture was made of many different woods: Macassar ebony, mahogany, palisander, burl walnut, ebony, and ash. The designs revealed the influence of several historical periods including traces of Louis XIV, Louis XV, Restoration and above all Louis Philippe. Mare defended the firm's eagerness to draw upon traditional styles in

an interview published in *Art et Décoration* in 1920 where he emphasised their flexibility and timelessness: "The Louis Philippe style, for a long time favoured in the provinces, is the most recent to date of French styles. It is rather clumsy, but earnest, logical, welcoming. It is responsible to the needs we still have. Its forms are so rational that the motor-car designer of today who draws the interior of a car uses them unconsciously. We are not reviving it; we are not deliberately continuing it, but we find it while seeking out simple solutions, and through it we bind ourselves to the whole of our magnificent past. We are not creating a merely fashionable art."

Commissions for important clients included a villa in Saint Cloud for the French actress Jane Renouard, the living room for the Duke of Coeli's palace in Madrid, a townhouse for the Countess Goyenche also in Madrid, and furniture for Charles Stern, Monsieur Kapferer, Monsieur and Madame Girod, and Jacques Doucet.

Few other furniture designers of the period developed a more distinctive style. The squared scroll feet on their mid-1920s chairs, and the mother-of-pearl and silver veneered floral bouquets on matching ebony commode and cabinet are particularly noteworthy and characteristic of their work. And not only did their furniture echo past styles, it was also elegant, luxurious, comfortable and profoundly French. Süe and Mare described their broader philosophy in a catalogue note of 1928 where they explained: "Our Art is essentially 'human'. We believe that our dwellings are made essentially for human beings and not for automatons. Therefore we strive for warmth and harmony, supple lines and reposeful forms, in order that the home be restful and in contrast with an ever more exacting and harassing type of existence."

Süe and Mare's contribution to the 1925 Paris Exposition Universelle eclipsed all their earlier work, and their pavilion, *Un Musée d'Art Contemporain* on the Esplanade des Invalides, received nearly as much attention as Jacques-Emile Ruhlmann's nearby *Hôtel du Collectionneur*. Consisting of a rotunda and gallery, the interior was decorated by a large team of collaborators including sculptors, carpet and textile designers, and painters. The effect was extraordinarily colourful and lavish, with carved giltwood furniture upholstered in Aubusson tapestry. In the dining room section, Süe and Mare designed heavily scrolled and floral tablewares such as tureens and vegetable dishes, whose opulence evoked the Louis-Philippe era. Their imposing desk in Gabonese ebony, incorporating *ormolu* feet cast as elongated fronds, was purchased directly by the Museum of Modern Art in New York. Elsewhere, the firm displayed furniture in the *Ambassade Française*, the *Parfums d'Orsay* boutique, and the *Salle de Fêtes*. They also designed a harpsichord in the Pleyel stand, silver ornaments for Christofle-Baccarat, and decorative key plates and furnishings in the *Fontaine et Cie* Pavilion.

The partnership lasted until 1928 when Jacques Adnet assumed directorship of the firm. Mare died in 1932. Süe continued working independently both as an architect and as an *ensemblier* until World War II. His commissions included shops, stage sets, offices and private houses, with a notable example being the imaginative and luxurious interiors created for Helena Rubinstein's Paris house in 1938 which included a silver-leaf finished Italian shell-settee as part of a dramatic range of fantasy furniture and numerous examples of modern

Süe et Mare: Grand Salon, 1925 Paris Exposition Internationale des Arts Décoratifs et Industriels Modernes

and African art. Süe settled in Istanbul during the war and lectured at the Academy of Fine Arts. He later returned to France and retired to Gascogne, near Bordeaux.

CATHERINE BUCKNER

André Mare. Born in Argentan, in 1885. Studied painting at the Académie Julian, Paris. Shared a studio with Fernand Léger, 1903–04; exhibited at the Salon d'Automne and the Salon des Indépendants, 1904. Designed furniture, bookbindings and interiors from 1910; exhibited interiors at the Salon d'Automne 1911–13. Married Charlotte Mare. Served in the French forces during World War I. Associated with Louis Süe from c.1910: co-founder of the decorating and design firm Compagnie des Arts Français, 1919; partnership dissolved, 1928, after which he concentrated on painting. Died in Paris, in 1932.

Louis Süe. Marie-Louis Süe. Born in Bordeaux, 14 July 1875. Moved to Paris and studied painting at the Ecole des Beaux-Arts, 1895–1901. Worked as a painter and architect; first architectural commissions executed with Paul Huillard, 1905–07. Designed furniture and interiors from 1910; associated with Paul Poiret, 1910–12; established L'Atelier Français, Paris, 1912; formed decorating and design company Belle France, with André Mare, by 1918; co-founder of Compagnie des Arts Français, 1919; worked independently as a decorator and architect from 1928; professor at the Academy of Fine Arts, Istanbul, 1939–44; worked as an architect and designer in France from 1945. Treasurer, Société des Artistes Décorateurs, 1936–37; president, 1939. Died in Paris, 7 August 1968.

Selected Works

The Louis Süe Archives are in the Institut Français d'Architecture, Paris. Examples of Süe and Mare's furniture are in the Musée des Arts Décoratifs, Paris, the Museum and Art Gallery, Brighton, and the Metropolitan Museum of Art, New York. Many of their interior schemes are illustrated in Badovici 1924.

- 1912 Maison Cubiste, Salon d'Automne (exterior by Raymond Duchamp-Villon; furniture by Mare)
- 1925 Pavillon, Musée d'Art Contemporain, Exposition Internationale des Arts Décoratifs et Industriels, Paris (decoration and furniture)
- 1925 Magasin de Parfums d'Orsay, Paris (façade and interiors)
- 1926–27 Villa, Saint-Cloud (building and furnishings): Jane Renouard
- 1927–28 Apartment, rue de la Faisanderie, Paris (decoration and furniture): Jean Patou
- c.1928 *Ile de France* liner (decoration and furnishings for the Salon de Conversation)
- 1934 24 quai de Béthune, Paris (interiors and furniture by Süe): Helena Rubinstein

Sullivan, Louis 1856–1924

American architect, designer and writer

There is no American architect whose buildings evoke images of his design elements as much as those of Louis Sullivan and, conversely, there is no architect whose exterior and interior decoration are as identifiable as that of Sullivan. His façade for the Transportation Building at the Columbian Exposition, the interior design of the Auditorium Theater Building, and the overall stencilling, fixtures, and decorative metalwork for such buildings as the Chicago Stock Exchange, Carson, Pirie Scott, and his several late bank commissions are world-renowned. Even the organic and vibrant ornamentation of his pioneering work on the skyscraper – in Chicago, St. Louis, and Buffalo – retains its freshness and appeal to later generations of viewers and professionals.

Sullivan learned his lessons early; the precision of his drawing was mastered at the École des Beaux-Arts in Paris in 1874, and his appreciation for non-derivative overall design was first observed during his brief apprenticeship with the architect Frank Furness in Philadelphia in 1873. The many projects created opportunities for work in the fast-growing Chicago of the last quarter of the 19th century, and Sullivan's facility in drawing and imagination attracted immediate attention. He quickly became the partner of Dankmar Adler, one of the most successful and trusted engineer / architects of the day, and soon had commissions for industrial buildings, private residences, and a wide variety of civic and religious structures. By the time a changing economy and standards of taste could affect him, Sullivan's own health, his antagonism toward those who disagreed with him, and other personal issues, combined to push him to the sidelines of the profession. His last years were devoted to writing his autobiography and expounding his architectural theories. Through his disciples and students, foremost among them being Frank Lloyd Wright, his name and ideas never went out of currency. With many of his commis-

sions destroyed, much of the best of his design is seen in museum-housed fragments and in illustrations of his work.

Frank Furness was one of the most idiosyncratic architects in the United States when young Sullivan was hired by him after his one year at the Massachusetts Institute of Technology, and his impact on the young man's style, values, and artistic vocabulary was profound. Construction was underway on Furness's Pennsylvania Academy of Fine Arts, one of the most flamboyantly decorated and colorful of American buildings, when Sullivan arrived at his office. Influenced by the polychromes found in Owen Jones's *Grammar of Ornament*, Furness passed a taste for foliated ornament and the juxtaposition of curvilinear decorative elements on to Sullivan. Both aspects of this taste can be found in the best of Sullivan's early buildings: the variety and complexity of the color combinations in the Chicago Stock Exchange Trading Room and the three-dimensional organic forms in the monochrome gold of the decoration of the concert hall in the Auditorium Theater Building.

Along with the major commissions for skyscrapers, "proud and soaring things," came opportunities for decoration on an entirely new scale. Sullivan introduced the vigorous, organically inspired, and non-derivative spirals and foliage in the horizontal bands between the windows, around the entranceways, and even at the cornices of his commercial buildings. Interiors were as richly embellished, with particular attention paid to balustrades, light fixtures, and the cages of elevators. Eschewing all classical references, the buildings are a unique American response to the same mixture of technological advance and exuberant ornament that was found in the work of many European Art Nouveau designers. In the later small bank commissions, external ornamentation is often more localized around the portals and few large windows, but the interiors are a carefully controlled riot of color and three-dimensional foliage. In such buildings as the National Farmers' Bank, stained glass, stencilled walls, gilded plasterwork, and painted terracotta are combined in a brilliant tour de force. Even such furnishings as baskets and trays are part of the organic whole of the design. His designs for light fixtures, rich and flowing with a wheel of lights near the base of a multi-colored hexagonal column, were as vital as the designs for the fixtures at the Auditorium Theater, twenty years earlier.

As Furness had passed on his sense of non-derivative and non-historical ornamentation to Sullivan, so did Sullivan's close employees and disciples, George G. Elmslie and Frank Lloyd Wright learn from their master, with Wright becoming so proficient in doing original designs in the style of Sullivan that he was for a time known as the older man's "pencil." As Sullivan encouraged their own creative work within the body of his own commissions, it is often hard to attribute specific designs to either him or his helpers. In spite of his decline in personal fortunes and the paucity of commissions during the last two decades of his life, his work remained much admired by architect friends, former clients, and by such highly respected members of the European architectural community as H.P. Berlage. Pieces of ornament from the late banks were so admired that fragments of the terracotta work were requested by the Louvre, in Sullivan's lifetime. Once again, in the Postmodern world of the late 20th century, Sullivan's sense of color, shape, and desire to create without following the

example of past civilizations, has spawned both interest and study. Considering his use of specially manufactured applied ornament, the flurry of current replication of aspects of his design and the prices paid for examples of it by collectors and museums, would probably have pleased him. More a product of his experience and time than the embattled man saw himself, Sullivan's rich and varied designs remain a high point in late 19th and early 20th American architecture and interior design.

DAVID M. SOKOL

Biography

Louis Henry Sullivan. Born in Boston, Massachusetts, 13 September 1856. Studied architecture at Massachusetts Institute of Technology, Cambridge, under William Robert Ware (1852–1915), 1872, and at the École des Beaux-Arts, Paris, in the atelier of Joseph-Auguste-Emile Vaudremer, 1874–75. Married Mary Azana Hattabaugh, 1899. Employed as a draughtsman by the architects Frank Furness (1839–1912) and George W. Hewitt (1841–1916), Philadelphia, 1873; worked for William Le Baron Jenney (1832–1907), Chicago, 1873; draughtsman in the office of Dankmer Adler (1844–1900), Chicago, from 1879; made a partner, 1882; firm listed as Adler and Sullivan from 1883; partnership dissolved 1895; active in independent practice, Chicago, from 1895. Pupils included Frank Lloyd Wright and George G. Elmslie. Published extensively on architectural theory and ornament. Died in Chicago, 11 April 1924.

Selected Works

The Avery Library, Columbia University, New York, and the Burnham Library, Art Institute, Chicago, have the largest collections of Sullivan's drawings, letters, manuscripts and memorabilia. For a full list of Sullivan's buildings and decorative designs see Twombly 1986.

- 1881–82 Revell Building, Chicago (building and interiors)
- 1887–90 Auditorium Building, Chicago (building and interiors)

Surrealism

Surrealism was a movement that encompassed writing, painting, sculpture, photography, film and design, but it had its roots in literature, and in particular the nihilist movement known as Dada. Launched by the artists Tristan Tzara and Marcel Duchamp, among others, Dada emerged in Paris in the aftermath of World War I. Rejecting conventional notions of content and form, it rejoiced in the pursuit of "nothingness" and revelled in the orchestration of well-publicised, anarchic and absurdist performances that were guaranteed to provoke widespread public outrage. Surrealism drew heavily upon the anti-bourgeois, subversive spirit of Dada but it was also infused with a new sense of purpose and meaning. The movement was formed in 1922 and the first *Surrealist Manifesto*, written by André Breton, was published in 1924.

Surrealism's aim was to create something more real than reality itself; to distil in poetry, prose or art the raw material of

thought rather than to reproduce a mere copy of what can be seen or experienced. Breton described it as "based on the belief in the higher reality of certain neglected forms of association, in the omnipotence of dream, in the disinterested play of thought" and its ideas owed much to Freud's work on the interpretation of dreams and the workings of the unconscious mind. Great emphasis was placed upon the use of spontaneous techniques such as automatic writing, free association, collage, and frottage (rubblings taken from everyday objects) that would conjure up images from the subconscious with no attempt at pre-cognition or post-arrangement. Such methods, it was hoped, would resolve the contradictions between dreams and reality and would lead to the ultimate Surreal image – the impromptu combination of unrelated objects. The mixing of incongruous and disparate objects was to prove equally applicable to interiors.

Surrealism was primarily a force within literature and the fine arts, and its prime exponents were the writers André Breton and Louis Aragon, and the painters Max Ernst, Salvador Dalí and René Magritte. But it also influenced a host of other artists including Jean Arp, Paul Klee, André Masson, Joan Miró, and Yves Tanguy and the sculptor Alberto Giacometti, and during the late 1920s and early 1930s Surrealist groups were formed in places as far apart as England and South America, Belgium and Japan. Surrealist ideas also proved extremely versatile and the movement attracted followers from many different forms of artistic expression including photography, theatre and film. The American Man Ray was its best-known exponent within the field of photography while Luis Buñuel's *L'Age d'Or* (1930) remains the supreme expression of Surrealist cinema.

The impact of Surrealism within the applied and decorative arts was less pervasive than in literature and painting, but Surrealist ideas played a significant role in the design of certain avant-garde furnishings and interiors during the 1930s and 1940s. The dislocating imagery of Surrealist thought was particularly applicable to furniture. Certain examples relied upon unexpected borrowings from nature; Marcel Jean's *Tree with Drawers* (1941), for instance, was a free-standing tree cut-out with a drawer attached to each "branch". Others featured anthropomorphic elements that had strong sexual overtones; Victor Brauner's *Wolf Table* (1939), for example, incorporated a wolf's head and tail, and Kurt Seligmann's *Ultra-furniture* included a stool made of four bent female legs (1938). Later echoes of Seligmann's designs can be found in the work of English artist-designer Allen Jones whose *Table* (1969), featuring a glass top secured to a kneeling female figure dressed in bondage wear, was used in Stanley Kubrick's cult film, *Clockwork Orange*.

Surrealism also influenced the design of whole interiors, inspiring a taste for unusual *trompe-l'oeil* effects and witty combinations of overscale or incongruous furnishings. The Mexican millionaire art-collector, Carlos de Beisteguy developed an interest in the style from quite an early date and collaborated with the Spanish architect-designer Emilio Terry to create a number of Surrealist rooms in the Paris apartment designed by Le Corbusier that he inhabited from 1931. Quilted walls and ornate Second Empire furniture were used in the interior, while the roof terrace was turned into an outdoor drawing room featuring an artificial grass carpet, Baroque-

Surrealism: dining room at Edward James's Monkton House, Sussex

style garden furniture and a heavy marble fireplace surmounted by an oval mirror that reflected views of the Champs Elysees.

Jean-Michel Frank (1895–1941), France's leading Modernist interior designer of the 1930s, was another important figure linked to Surrealist circles; he numbered many leading Surrealist theorists and artists among his friends, and several of the interiors that he designed for wealthy Parisian patrons were strongly influenced by their ideas. The cinema ballroom he designed for Baron Roland de L'Épée in 1936 is a particularly notable example. This room features striking decorations consisting of bright red carpets, and blue, green, pink and yellow walls, and the furnishings include theatre-boxes hung with purple velvet and the eccentric *Mae West's Lips* sofa designed by Dalí and based on his painting *Mae West* (1934). Frank commissioned two further versions of this sofa for the fashion designer, Elsa Schiaparelli. He also designed the interiors of the Vicomte and Vicomtesse de Noailles's Paris apartment where he revelled in the use of exotic and expensive materials that reflected his patrons' wealth and prestige: the apartment included vellum-covered walls, bronze doors with ivory detailing, sharkskin cabinets and tables, and modern seating upholstered in white leather. The interweaving of surreal and exotic elements was equally evident in the interior of Frank's private office where narrow wall panelling in

contrasting woods accentuated the height of the room and additional lighting was provided by wall lights in the shape of a bowl supported by a human hand. The final surreal "joke" was an oversized child's slate message board, complete with chalk and rubbing-out sponge.

The wealthy English patron Edward James embraced Surrealism both as a collector and as a style of interior design. James purchased several works by Dalí, Picasso, Magritte and Pavel Tchelitchew, and created a number of bizarre room settings at Monkton House, Sussex, which he transformed into a Surrealist shrine. The exterior of this Lutyens building was painted violet, the roof was retiled with black and green Belgian tiles, and billowing plaster aprons, imitating sheets being aired, were hung below some of the bedroom windows. The interior was decorated with a mixture of contrasting quilted and upholstery-style buttoned walls, and abstract, geometric wallpapers. The dining room was carpeted in green baize billiard cloth and contained two bright pink felt-covered *Mae West's Lips* sofas and a standard lamp also designed by Dalí, with the column suggesting a series of champagne cups balanced one on top of another. A stair carpet, designed by Norris Wakefield, incorporated the paw prints of James's two large Irish wolfhounds. Surrealist dream imagery was also liberally exploited in the bedrooms. In James's own room the walls were hung with silver net and the bed was inspired by a picture of Napoleon's hearse, with palms at each corner. A free-standing palm, constructed by his estate carpenter, stood in the alcove. James's bathroom featured peach alabaster walls and a shaving mirror depicting the world, with sun- and moon-shaped lights either side shining through the alabaster. The ceiling in the Map Room was of dark blue glass, backlit and studded with gold stars resembling the night sky.

The work of the painter and designer, Paul Nash (1899–1946) was in many ways more overtly Modernist than that of many of his contemporaries, but he nevertheless took a keen interest in Surrealism. Arguing that the random qualities prized by the Surrealists were necessarily at odds with the established principles of interior design, he attempted to define the ideals of the movement in terms of the decoration and arrangement of objects in rooms (*"Surrealism in Interior Decoration"*, *Decoration*, 1936). He styled a room-setting in London's bohemian Fitzroy Square that contained several interesting English Surrealist pieces including a side table with deep fingerprints pressed into the pedestal designed by Denham Maclaren, a vase by Rupert Lee containing a "flame of fur", a sheepskin ottoman by Duncan Miller, and a large painting by Edward Burra. Nash's celebrated glass bathroom for Edward James's wife, the dancer Tilly Losch, was more conventionally Modernist in style, featuring stippled and tinted glass walls, a mirrored ceiling, and fluorescent half-moon lighting, although details like the pink rubber floor and black bathroom fittings were both exotic and unusual.

The American decorators Dorothy Draper (1889–1969) and Rose Cumming (1877–1968) were also influenced by Surrealism. Draper employed oversize furniture and fittings at the Arrowhead Springs Hotel, and in her interiors for the Southern California (1935) and the Quitandinha Hotel (1944) in Petropolis, near Rio de Janeiro, while at the Hampshire House Hotel (1936), New York, the function rooms were reminiscent of Carlos de Beisteguy's Paris roof terrace and

Surrealism: interior at Arrowhead Springs Hotel, California, by Dorothy Draper, 1935

were designed as outdoor spaces, complete with garden furniture and a Georgian house exterior. Rose Cumming's Ugly Room (late 1930s) became a landmark in taste for the way in which it combined eccentric colour, a variety of weird and sinister objects, and many of the things that had been rejected over the years by the decorator's clients. Her own bedroom in New York was no less flamboyant, and used an exotic collection of shimmering materials such as satin, silk and metallic wallpaper and silvered furniture from Venice and India; her designs were inspired by both Surrealism and the Hollywood cinema.

More recently, the Surrealist legacy survives in the work of those contemporary designers who continue to exploit the effects of disparate combinations and unusual materials. The interiors designed by Gaetano Pesce for the Chiat / Day advertising agency in New York, for example, are clearly influenced by Surrealist ideas. Pesce's paperless office – a melange of primary colours within a free-floating organic space – is the antithesis of traditional corporate environments. The "store" counter, where employees sign for the technological gadgetry and workspaces they need, is surrounded by a pair of giant red lips with a tongue as the counter itself. Walls are felt-lined and

timber-boarded, with chalkboards for notes and jottings; doors are button-padded and bottle-shaped; employees' locker doors are amorphous face profiles; brightly-coloured resin floors resemble abstract painting or, in the case of one office (called the "doghouse"), depict a dog profile in resin and marble dust. The wit and irreverence encapsulated in such features are characteristics now closely associated with Postmodernism, but they are equally indebted to Surrealism. Similarly, Paul Eluard's prediction that "one day houses will be turned inside out like gloves" (1933) seems to anticipate the work of Modernist architects such as Richard Rogers whose Pompidou Centre in Paris, and Lloyd's Building in London boldly display the internal services on the exterior of the building. Overturning conventional design, these buildings appear to owe something to the dislocation of normal expectations that is so central to the Surrealists' view of the world.

NICHOLAS NUTTALL

Selected Collections

Many Surrealist artefacts are in private collections but examples of Surrealist furniture can be seen at the Museum and Art Gallery, Brighton, and at the Edward James Foundation, West Dean, Sussex.

Examples of designs and textiles by Paul Nash are in the Victoria and Albert Museum, London.

Further Reading

There are many histories of Surrealism and the fine arts but there is as yet no comprehensive study of its influence in design and the decorative arts. Introductory accounts appear in Calloway 1988, and Massey 1990, with more detailed discussions in Battersby 1988 and Calloway 1994. Further information can be found in monographs and articles relating to particular designers, patrons and decorators.

Sustris, Friedrich (Federico di Lamberto)

c.1540–1599

German architect, sculptor, painter and designer

The painter, designer and architect Friedrich Sustris played an important role in the introduction of the Mannerist style in architecture and decoration into South Germany in the last years of the 16th century. Born around 1540, perhaps in Padua, Sustris was taught by his father, the Amsterdam painter Lambert Sustris, who was active in the 1540s and 1550s in Venice and the Veneto, and then later, between 1563 and 1567, in Augsburg. From 1563 to 1567 Friedrich was a pupil and assistant of Giorgio Vasari in Florence, working with him on the decoration of the new apartments in the Palazzo Vecchio and in association with Jacopo Strada on the decorations for Michelangelo's funeral (1564). In 1565 he worked with Stradano under Vasari's direction on the decorations for the *entrata* of Johanna of Austria into Florence. He was also employed by the ducal *Arazzeria* on the designs of various

tapestries for the private rooms of the Palazzo Vecchio and in 1567 he was made *consigliere* of the Accademia del Disegno.

In 1568 his career took a new direction when he was called to Augsburg to decorate some rooms in the mansion of the banker Hans Fugger. These included the library, the *kunstkammer* or art cabinet, the banqueting hall and chapel. The work involved painted, stucco and marble decoration, and Sustris employed a team of assistants, including Antonio Ponzano, Alessandro Scalzi and the stucco worker Carlo Pallago, many of whom worked with him on subsequent commissions.

Sustris remained in Augsburg until 1573 when, on the recommendation of Fugger, he entered the service of Crown Prince Wilhelm, later Duke Wilhelm V of Bavaria. Like the previous Duke, Albrecht V, Wilhelm was keen to emulate the levels of artistic patronage and display frequently found in Italy. Indeed, such was his munificence that by the end of his reign Bavaria was on the verge of bankruptcy, but the country had also become home to many of the most important artists of the period including Sustris, Pieter Candid, Orlando di Lasso and Hans Krumpfer. Sustris's first commission was to decorate Burg Trausnitz, a 13th-century castle near Landshut. He and his assistants painted a number of frescoes on the theme of the *commedia dell'arte* on the "Narrentreppe", or "Fool's Staircase", and decorated some of the new Italian apartments; all the work was in the latest Florentine Mannerist style. The "Narrentreppe" frescoes have sometimes been attributed to Alessandro Scalzi; sadly they were destroyed by fire in 1961.

In 1580 Sustris moved to Munich where in 1586 he was appointed *Kunstintendant* with powers as absolute director of the team of artists working at the Munich court. His most important work was undertaken in the Residence, a building constructed between 1559 and 1571, but added to by Wilhelm during the late 1570s and 1580s. Sustris systematised the Grottenhof, or *cortile della grotta*, and completed the decoration of the Antiquarium. The Antiquarium was the first classical museum of its kind in Germany, where Wilhelm housed his many antique statues and the vast library that he had acquired from Johann Jakob Fugger. In addition to his usual team of assistants, Sustris also employed Pieter Candid who provided some of the paintings set into the ceiling. The result was an Italianate-style space with a gently curving ceiling and a series of bays with spandrels by the windows that were decorated with the classicising grotesque ornament similar to the type previously used by Raphael and his studio in the Vatican and in the Villa Madama.

The Grottenhof was an even more striking invention. The central area consisted of a garden, laid out in a style similar to that of the Medici gardens at Castello and Pratolino, with four flower beds in wooden boxes, and a fountain in the centre containing a reproduction of Benevenuto Cellini's statue of Perseus in the Loggia dei Lanzi in Florence. One of the side areas of the courtyard contained a grotto, covered by a loggia, which was constructed out of tufa and decorated with crystals and various kinds of coloured shells. The decoration was set into a strikingly classicising pattern of pilasters, niches, arches, reversed volutes and around corbels that ended in fictive baskets of flowers and plants. On one niche were the arms of the Duke of Bavaria; in another was a replica of Giovanni da Bologna's bronze statue of Mercury resting on a tufa base,

Sustris: Antiquarium, Residenz, Munich, 1586

again covered with crystals and shells. Half-visible forms, made of shells and stones and emerging from the decorations, appear reminiscent of the mysterious and suggestive images painted by Archimboldo. But the strongest influence, in the figures and decorative patterns both here and elsewhere, is that of the Florentine Mannerism that Sustris had learnt from Vasari. The effects of Sustris's rich and inventive style were evident in many parts of South Germany in the late 16th and early 17th centuries. The direct influence of his work is apparent, for example, in the work of the painter Johann Kager (1575–1634), while the broader impact of Sustris's taste is evident in all the subsequent decorations carried out in the Residence during the Baroque and Rococo periods.

Soon after the Grottenhof had been commissioned Wilhelm became increasingly religious and began to patronise the Jesuit order. He erected two monuments – the Jesuitenkollege of 1585 and the Church of St. Michael, built between 1583 and 1597 – to celebrate the success of the Counter-Reformation in South Germany. Sustris was involved in both projects, and the Church of St. Michael was an especially important design both in its plan and in the façade, which was indebted partly to the style of South German ecclesiastical architecture, but whose pattern of pilasters, cornices and niches also recalled, in its symmetry and clear decorative language, the models of similar buildings in North Italy and the work of architects such as Galeazzo Alessi. The interior stucco decoration was also notable, especially in the areas around the Choir and the High Altar, all of which were executed under Sustris's supervision even if he himself was not responsible for the actual designs.

Sustris was essentially a practical artist and he seems to have known little of the Renaissance theory of architecture. But in the twenty years that he spent at the Court of Munich he introduced and encouraged the acceptance of a form of Italian design that was to remain in place in this area of South Germany for many years and which was to influence the later development of the German Baroque.

Biography

Name also appears as Süstris, Susterus, and Sustrich. Born in Italy, c.1540; son of the painter Lambert Sustris (before 1520–after 1568), with whom he probably first trained in Venice. In Rome, 1560. Pupil and assistant of Giorgio Vasari in Florence, 1563–67. Married the daughter of Padoano Cartaro, a playing-cards' painter, before 1564 (perhaps Birgitta Sustris, who died in Munich, 1605): three of his sons, Ottheinrich, Georg and Lambert, were painters; had three daughters. Member of the Accademia del Disegno, 1564, and *consigliere*, 1567. Worked for Hans Fugger in Augsburg, 1568–69. In the employ of Prince, later Duke, Wilhelm V of Bavaria, in Landshut and Munich, c.1569–90, as court architect (*oberbaumeister*) and Kunstintendant from 1586; also designer, collaborating with Alessandro Paduano (his brother-in-law), Antonio Maria Viviani, Peter Candid and Antonio Ponzano; and provided sculpture designs for Carlo Pallago and Hubert Gerhard. Provided large number of designs for architecture, gardens, sculpture, goldsmiths' work. Died in 1599.

Selected Works

A large number of his designs and drawings are preserved at the Staatliche Graphische Sammlung, Munich; the Albertina, Vienna; and several German and European collections (see Feuchtmayer 1938).

- 1563–67 Palazzo Vecchio in Florence under direction Giorgio Vasari (decoration of new apartments): Grand Duke Cosimo I de' Medici
- 1564 Michelangelo's funeral, Santa Croce, Florence (decorations for catafalque): Grand Duke Cosimo I
- 1565 Designs for decorations for marriage of Francesco I de' Medici and Johanna of Austria (under direction of Vasari)
- 1565 Designs for Medici tapestries: Grand Duke Cosimo I
- 1568–73 Fugger Palace, Augsburg (designs for painted, stucco and marble decoration, library, *kunstkammer*, banqueting hall, chapel, together with Antonio Ponzano): Hans Fugger
- 1573–80 Burg Trausnitz, Landshut (with Carlo Pallago, Alessandro Paduano and Antonio Ponzano; "Narrentreppe" [Fools' Staircase]; architect and designer of stucco and fresco decoration of new Italian apartments; "Zwinger" garden): Crown Prince (later Duke) Wilhelm V of Bavaria
- 1580–81 Grünwald Castle: Duke Wilhelm V of Bavaria
- 1581–86 Grotto Courtyard, Residence, Munich (grotto decoration, design for *Perseus* fountain; various inner garden courts): Duke Wilhelm V of Bavaria
- 1584 Starnberg Castle: Duke Wilhelm V of Bavaria
- 1586 Antiquarium, Residence, Munich (remodelling as banqueting hall, fresco and furniture designs): Duke Wilhelm V of Bavaria
- c.1590 Reiche Kapelle, Residence, Munich (designs for silver and engraved glass): Maximilian I of Bavaria

System Furniture

The office interiors of most large commercial organisations are today dominated by system furniture. Indeed, it has become so ubiquitous that it is now the starting point, around and after which the rest of the interior is designed. A system is defined by a limited inventory of standardized parts that can be arranged in a number of configurations, each facilitating a different task and / or occupying a different space.

During the mid 1950s, a German management consultancy, Quickborner Team, argued for open-plan offices (dubbed *Bürolandschaft* or office landscapes) where the layout of furniture was principally determined by the flow of paper through the organisation. Most existing furniture was not suited to the constant need for reconfiguration demanded by such ideas (or to the aesthetic of an apparently status-free environment), and, as a consequence, manufacturers began designing lightweight furniture which could carry screens and services. Furniture systems designed around a limited number of standardized parts, and which could (theoretically) be dismantled and reconfigured by the end-user, clearly represented a logical response to such a scenario. Among the first manufacturers to pursue this concept was Olivetti, whose aesthetically spare *Spazio* system (1961) made possible as many as twenty models of desk, through different configurations of a limited number of interchangeable modules.

The early 1960s also saw a systems approach applied to storage, although developments in this area were less a direct response to *Bürolandschaft*, than the further refinement of existing filing furniture. Of particular note were the wall-mounted storage elements of the Danish *Roepstorff* system, which were designed around the international "A" series of paper sizes and constructed from standardized plywood components. The leading British example, Hille's *Storage System* (1963), designed by John Lewak and Alan Turville, offered a wide range of standard elements, including shelves, filing frames and work-surfaces, all of which could be hung between a pair of wall-mounted panels. The need for a supporting wall was avoided completely by the Swiss *Haller* system; a limited inventory of chromed steel tubes, ball joints and coloured infill panels which made possible an enormous variety of free-standing storage units (and desks). Despite its inherent flexibility, early users of the system tended to devise configurations based on existing ideas of office layout, rather than re-examining the office from first principles. By the mid-1960s, however, system furniture was being developed which sought to combine the perceived advantages of cellular offices – privacy, quietness and space "ownership" – with those of *Bürolandschaft*; improved communication and some sense of egalitarianism.

At the forefront of these moves was Robert Propst, director of Herman Miller's research division, and author of *The*

System Furniture: storage units by Charles Eames, c.1950

Office: A Facility Based on Change (1968). Working with George Nelson, designer of the seminal *Storage Wall* (1945), Propst devised the *Action Office* (1964). Designed around a T-shaped, die-cast aluminium frame, the “system” consisted of two desks of different heights with integral electrical outlets, suspended filing and rolltops to hide clutter. To these could be added shelves, raised work-surfaces and “communication units”. Largely because of the expense of its manufacture, *Action Office* was not commercially successful, despite the enthusiasm which had greeted its launch.

With Propst and Nelson’s *Action Office 2* (1968), however, Herman Miller secured enormous commercial and critical success, effectively defining the dominant shape of system furniture and, by extension, that of the corporate office for well over a decade to come. AO2 was relatively cheap to manufacture, making considerable use of moulded plastic. Its real significance, however, lay in the abandonment of the conventional free-standing desk for a system of self-supporting screens on which could be mounted a combination of standardized components, including work-surfaces, telephone holders, filing frames, storage modules and noticeboards. AO2 had an enormous impact on the aesthetic and functioning of the office interior. As Francis Duffy has noted, it “showed designers how to break with the right angle in planning furniture layouts” (Duffy 1992). More importantly, it reintroduced some degree of organisational hierarchy and territoriality to the office landscapes, without reverting to cellularization.

The 1970s saw the furniture market flooded with systems. The other design-led American giant of the industry, Knoll, launched its wooden *Stephens* system in 1973, and, although it clearly owed a great deal to Propst’s ideas, it stopped short of abandoning the free-standing desk altogether. Where a work-surface was combined with other elements, it was surrounded on three sides by high structural screens, arguably giving the system a rather square and bulky appearance. Despite that, *Stephens* was a massive hit, its use of wood appealing to the more conservative companies’ desire to extol solid and traditional values. This consideration perhaps also lay behind the choice of wood for Hille’s *Office System* (1973), designed by Alan Turville, and which, through its use of similar structural screens, purveyed a not dissimilar aesthetic. Other important 1970s systems included Olivetti’s aesthetically radical *Synthesis 45* (1973), designed by Ettore Sottsass, which introduced bright colours and humorous details to the generally conservative world of the office, and George Nelson’s *Workspaces* system for Storwall (1977) which proposed that interior surfaces should be soft and welcoming, while exteriors should be hard and durable.

The introduction of desktop computers to the workplace in the late 1970s posed new problems for the designers of systems, principally that of cable management. Among the first to address this issue was Sunar’s *Race* system (1979), which carried electrical cables through a structural beam, onto which a range of work-surfaces, storage modules and screens could be attached. Other beam-based systems followed, including Herman Miller’s prohibitively expensive *Burdick Group* (1980). Essentially an executive desk system rather than a

comprehensive office package, *Burdick* was made up of cast aluminium components, and purveyed a High-Tech aesthetic which prefigured that of Tecno’s *Nomos* system (1985) designed by Foster Associates. Like *Burdick*, *Nomos* was fundamentally a table system, offering no screens or floor-standing storage units within its inventory. While other systems sought to conceal cables within screens or legs, *Nomos* celebrated office technology by allowing them to remain visible, threaded through an innovative plastic spine. *Burdick* and *Nomos* intentionally dissociated themselves from the mainstream of system furniture, although other beam-based systems secured widespread application. Of particular note was Castelli’s *From Nine to Five* (1986), designed by Richard Sapper, in which cabling was ducted through a triangular-section structural beam which also incorporated electrical outlets.

Meanwhile, the development of screen-based systems continued apace. Seventeen years on from AO2, Herman Miller launched *Ethospace* (1985) designed by Bill Stumpf. Intended to make reconfiguration simple, *Ethospace* recognized that the constructional complexity of many systems restricted the ability of individual users to rearrange their own space. Designed around a system of free-standing “walls” of frame-and-tile construction – in which coloured plastic tiles could easily be swapped for fabric, transparent, veneered or accessory-carrying tiles – *Ethospace* sought to allow individual users to personalize their own workstation (assuming of course that their employers accorded them that privilege).

While numerous other systems have come and gone around it, *Action Office 2* remains in production, its inherent flexibility allowing Herman Miller to adapt it over time to accommodate new technology and cater for ever-changing tastes. Ironically, this flexibility has undermined some of the ideas which brought system furniture into existence. Originally posited as an alternative to the cellular office, the system, like many others, now offers floor-to-ceiling screens for complete enclosure. Egalitarianism has clearly assumed diminishing importance – a plethora of colour and finish options have become the principal signifiers of office hierarchy.

T

Tables

The term table is derived from the word *tabula*, Latin for board. While it could be said that all tables are varieties of board, the amazing differences between shape, use, decoration and stylistic features make them far more than simply flat surfaces.

Like other furniture types, tables originated in ancient Egypt. Initially they were usually small, and were hardly more than stands for food or offerings. More sophisticated were “tables” that were gaming boards mounted onto legged frames, these being the earliest example of games tables. The Greeks used tables more than the Egyptians but there was still no large dining table. Tables for dining were low enough to be used at the appropriate height and were pushed under couches when not needed.

The Romans developed tables from the Greek models. They also introduced types of their own. Dining was often in a separate dining room or *triclinium*. While the guests ate from small and round tables, often made in bronze or silver, the catering was done from a serving table, made from marble or wood slabs mounted onto carved marble bases. Byzantine tables followed classical models, but were sometimes fitted with drawers and lecterns, in a variety of shapes including the circular.

During the medieval period, the nature of society started a long process of change. The Great Hall housed all the household for meals. The high table would stand on a dais facing the screen at the other end of the room, while other tables were set up as required. They were based on the trestle principle which allowed them to be moved and assembled easily. It appears that tables were often rather rough in finish, so requiring magnificent drapes to make the necessary display.

By the 16th century, the habit of communal eating was breaking down. The idea of a fixed table (*table dormant*) in the hall also fell away as the establishment of dining parlours continued. This meant that the dining table took on a greater status and developed more forms than it ever had before. Dining parlours were smaller, therefore the tables needed to be smaller, but on occasions extendable. This was achieved by a most important innovation, namely the extending table mechanism, which appears to have developed in the Netherlands before 1600. It is designed to allow the leaves to be drawn out upon tapered bearers (loppers) thus virtually doubling the size

of the table top. So successful was this idea that it has remained in use to this day.

In Italy, massive carved tables derived from Roman models were made with carved marble supports and inlaid tops. Wooden versions used an architectural framework combined with imaginative use of mythological motifs, in keeping with the Mannerist interiors they were intended for. The Farnese table (Metropolitan Museum, New York) is one such example. These magnificent objects were seen as suitable contrasts to the plain decoration of walls and floors. In France the *table à l'italienne* became an ornamental piece made in an architectural style with massed carvings, stretchers and sliding tops. In other cases, marble or marquetry was evidently used for decorative tops.

The need or desire for tables of all sorts quickly spread around Europe. In England one wealthy family's inventories included 25 tables of walnut or marquetry, and 15 of marble, out of a total of 89 tables (Lumley inventories, 1590). At the other end of the scale, the chair-table was one of the earliest types of convertible or metamorphic furniture; this had the back fixed on a pivot so that it could be lowered onto the arms to create a table, and proved useful in confined interior spaces.

As the demand for dining tables grew, most countries in Europe produced either the fixed-top table or the draw-leaf table, supported upon a leg at each corner held by stretchers. An alternative from Germany used X-shaped end supports. In England the trestle table was now longer, and made with a fixed or sliding top, using a panelled construction and a fixed underframe. The Elizabethan models continued into the 17th century, but with a tendency to reduce the amount of carving and the thickness of legs. Initially made up from built-up sections, they were later only made from the thickness of the leg timber itself. Gate-leg tables, with circular, rectangular or oval tops were developed to suit smaller family living quarters. In addition, the gate-leg table could be used in larger houses by being set up in any convenient space rather than having a fixed position.

Distinct from dining tables, which were becoming less ornate, were console tables. Italy re-introduced this decorative table during the 17th century. These are usually highly carved and are often classed as sculptures rather than simply tables. They are fixed to the wall with bracket feet and should not be confused with pier tables or side tables which are free-standing.

Pier Tables

Tables: pier tables by George Hepplewhite from *The Cabinet-Maker and Upholsterer's Guide*, 1794

The Baroque style was ideal for the new-found need to demonstrate one's position in society through interiors and their furnishings. Carving and gilding lent themselves ideally to this need, and examples of tables which were used as a vehicle for this taste can be found in most European countries. Whether in Paris, Munich, Amsterdam, or London, the accumulation of auricular style, putti, garlands, and flowers all combined to create an exuberant effect in table design. One of the most spectacular products of the period aiming at feeding this desire for display was the table top comprising *pietre dure*. The most amazing tour de force was the table top produced by the Opificio delle Pietre Dure in Florence for Ferdinando de Medici, during the period 1643–49. Many such table tops were commissioned by European travellers to be sent home. If this was too costly, *scagliola* or exquisite wooden marquetry panels could be mounted upon table tops to create an exuberant

effect. Yet another decorative method used to achieve the same result was *boulle* work. Table tops would be covered with a pattern of tortoiseshell and metal (brass or pewter usually). In exceptional circumstances glass might be used to decorate a table (Louis XIV's glass table by Perrot) with incomparable results.

The table was also included in a newly-devised decorative arrangement called a Triad. Introduced in the 1670s and remaining popular until the early 18th century, this comprised a matching set of table, looking-glass and candlestand, all set against a pier.

Although there had been a variety of types of table in previous centuries, it was in the 18th century that there was a massive increase in special-purpose furniture and tables in particular. This was due in part to the desire for intimacy, in part to the increase in the range of activities in a household, and in part to the need for special-purpose furniture for various rooms.

The centre table no longer took pride of place and was reduced in size and often fitted with simple wooden tops and cabriole legs. The console table took a major place within the interior scheme as it was fitted below a tall mirror within the panelled walls. The side table also assumed greater importance as a component of the scheme.

For private use, specialisation of function meant that tables were devised for artists or architects, coffee or tea, work, bedside, serving, games (troumadam, backgammon, bagatelle, billiards, chess, etc.) writing, and breakfasting activities. Numerous other table types were introduced or re-designed during the century. These included console tables fitted with marble tops and painted frames; dumb waiters; writing desks; and library tables. By 1710, kneehole writing tables had been introduced as one example of a number of special-use objects. By 1750 the tea-table or tripod table was used and it soon developed a tilting mechanism by being hinged to a small cage, making it ideal for storage or firescreening. Other special-purpose tables included sofa tables, library tables, and toilet or dressing tables. Around 1730 card tables with square corners were introduced, while the ever-popular pedestal or wine table developed around the same time. Writing tables or *bureaux plat* continued to be popular. Some contained drawers, while others had secret compartments that rose up, and yet others were supplied with a filing cabinet.

The French, typically, developed a number of specialised table types for particular tasks. The *serviteur fidèle* was a small table with articulated arms for candlesticks, designed to assist reading. The *table à la Bourgogne* was fitted with a divided top, half of which rises up into a *secrétaire*. The *table de lit* was intended for the convenience of anyone sitting up in bed, while the *table en chiffonier* was a work table with high galleries around the top and lower shelf. The *vide poche* was planned with a deep rim to the top to contain the contents of pockets after undressing for the night.

One of the most ubiquitous table types of the 18th century was the gateleg. For dining, the gateleg table was still in use in the early part of the century, to be superseded by the swing-leg table. In American gateleg tables, the butterfly support is more graceful than the European gateleg mechanism.

Mahogany flap dining tables often had four or six legs with oval or circular tops and used the gate-leg principle to support

the flaps. By the mid-century it was common to extend a dining table by adding two semi-circular pier tables at each end of the gateleg table. From 1770 the "Carlton House"-style writing table was introduced. It had a low superstructure with tiered drawers and was first depicted in the 1792 *Cabinet Maker's Book of Prices*. It is presumed to have been named after the Prince Regent's Carlton House, London.

Two new types of table are associated with the early 19th century; the centre pedestal table and the sofa table. The centre table had a number of incarnations including the drum table, the capstan or rent table, and the dining table. The fashion for less formal arrangements of furniture, with pieces being pulled out from their intended positions against the walls and placed permanently out on the floor, encouraged the development of small occasional tables that could be placed adjacent to sofas and chairs. Sofa-tables were first introduced in England c.1800 and were usually rectangular in shape. Smaller tables, such as the nest or quartetto of tables, work tables with pouches, and writing tables also proliferated during this period. There was also a return to the fashion of longer dining tables.

During the 19th century many tables were considered part of a unified interior scheme, depending upon which particular style was being invoked. Interesting examples of attempts to improve the methods of extending table size were part of the attraction of "patent" furniture during the first half of the century. Tables were designed to fold down, rise up, or extend by a variety of novel means.

Like many others before them, some 19th-century architects were unhappy with prevailing styles, so set about designing furniture to suit their ideals and interiors. A.W.N. Pugin and his spiritual successors in parts of the Arts and Crafts Movement encouraged table designs that reflected medieval style. These models seemed to show ideas of honesty through revealed construction, truth to materials through solid timbers, and simplicity through functional, basic type-forms.

In the 20th century architects have once again turned towards designing furniture, including tables, for the interiors of their buildings. Mention of Frank Lloyd Wright, Gerrit Rietveld, Marcel Breuer, Eero Saarinen, Robert Venturi, and Michael Graves indicates the scope of these designs. In some cases the designs for tables and other furniture were intended for one location; in others they were meant for bulk production.

Avant-garde architects and designers were also often interested in new or revived materials. During the 20th century, tables have been made from wood (including plywood, fibre-board, laminated wood), metal (including rod, sheet, tube), glass, plastic, stone, and wicker.

An interesting light on furniture design was cast by the Utility scheme in Britain during World War II. The dining tables that were planned for this scheme were based on the frame and panel construction with extendable drawer leaves, not unlike the principle of Tudor dining tables 400 years earlier.

One of the most ubiquitous stylistic influences on dining furniture has been Scandinavian designs made in teak veneers. This look of elegant simplicity, combined with the warmth of the timber, furnished much of Europe and North America from the 1950s to the 1970s.

Changes in lifestyle have always led to new kinds of tables.

One of the defining tables of the late 20th century interior has been the coffee table, which has become ubiquitous, in an amazing variety of forms.

Talbert, Bruce 1838-1881

British architect and designer

A prolific designer of furniture, textiles, wallpaper, stained glass, metalwork and tiles, Bruce Talbert was a central figure in the Aesthetic Movement and a leading interpreter of the reformed Gothic style. Described in an obituary as the "most original and remarkable furniture designer" of his age, he was also regarded as one of the foremost designers of interiors, a "pioneer in the better phases of modern taste". Much of his reputation within both these areas derived from his two books: *Gothic Forms Applied to Furniture, Metal Work and Decoration for Domestic Purposes* (1868), and *Examples of Ancient and Modern Furniture, Metal Work, Tapestries, Decoration, Etc.* (1876). Both works were published in several editions and their designs were widely copied by manufacturers on both sides of the Atlantic. Today, Talbert ranks with Christopher Dresser as one of the first industrial designers of the 19th century, supplying drawings for both cabinet-makers and industry, and exercising a profound influence on commercial design.

Trained as a wood-carver and architect, Talbert began designing furniture in the early 1860s. By the end of the decade he had already worked for Gillows of Lancaster, J.G. Crace of

Talbert: drawing room from *Examples of Ancient and Modern Furniture*, 1876

London, Marsh, Jones and Cribb of Leeds, Smith & Son of Dundee, and several Manchester firms including Lamb's, Ogden's, and Doveston, Bird & Hull. He had also designed metalwork for the Coalbrookdale Ironworks in Telford, Cox and Sons, and for Francis Skidmore, who may well have provided important introductions to the architects William Burges and G.E. Street through their mutual contacts with the Ecclesiological Society. Carpets, tapestries and textiles were among other commissions Talbert undertook, and numerous designs for wallpapers for Jeffrey & Co. followed in the 1870s. His Anglo-Japanese *Sunflower* pattern of 1878, featuring the leitmotif of the Aesthetic Movement, was awarded a gold medal at the Paris International Exhibition of the same year, and Talbert designed many of Jeffrey's matching frieze-fill-dado decorations, hand-printed in complementary colours, that were favoured in Artistic homes.

Gothic Forms appeared in the same year as Charles Eastlake's *Hints on Household Taste* and the two publications shared many of the same ideas. Both, for example, emphasised truth to materials, honesty of construction, and a belief in the propriety of the Gothic style. However, whereas Eastlake's book was aimed at consumers, Talbert was writing essentially for the trade. *Gothic Forms* was inscribed to a fellow-architect, G.E. Street, and was intended for use by furniture manufacturers and cabinet-makers. In it, Talbert exhibited a markedly

un-Gothic sympathy with the techniques of mass-production. For example, he advocated the use of inset enamelled plaques which could be easily mass-produced, and, although he criticised excessive use of veneer and glues, he maintained that modern glues could be extremely effective for strengthening tenons, and that the inlay of woods could be justified on the grounds that some woods were too expensive and scarce in England to use in their solid form. His approach was therefore far less fanatical than Eastlake's, and his modern and practical style of design ensured that *Gothic Forms* "soon found its way to the chief designers and cabinet-makers in the Kingdom, and imitations ... were produced on all sides". His extensive personal interpretation of neo-Gothic motifs, such as his use of geometrical "pies", quatrefoils on lozenges, chevron mouldings, and springy interlacing plant stems, were illustrated throughout the plates either by metalwork, marquetry, inlay or carved detail, and could readily be adapted within the commercial sector. Talbert himself expected his work to be refined and copied, and sub-Talbertian detail dominated the popular end of progressive design for several decades.

Talbert's prize-winning pieces of furniture at three international exhibitions illustrate the range of his style. Holland & Sons were awarded the silver medal in Paris in 1867 for their exhibit of Talbert's *Pericles* sideboard, so-called in reference to the frieze quotations from Shakespeare's play and its sculptural

decoration. The *Art Journal* proclaimed it as “certainly the most distinguished among competing Gothic works” and, although this description represents something of a simplification, markedly Gothic elements are apparent in the trefoiled and crocketed pediment, the decorative hinges, the stump columns, and the use of geometrical roundels and conventionalised plant forms. The *Pet* sideboard, shown by Gillows in London in 1872 and subsequently purchased by the South Kensington Museum, encapsulates Talbert’s Old English Style with bobbin-turned decoration, carved instead of inlaid panels, and a carcass of fumed oak. A magnificently inlaid, ebonised and decorated exhibition piece, entitled the *Juno* cabinet, was awarded the Grand Prix at the Paris exhibition of 1878 and illustrates Talbert’s increasing interest in Aesthetic design. Many of his patterns of this period contain Anglo-Japanese motifs, and in the *Juno* cabinet he not only emphasises the rectilinearity of the frame but also includes motifs such as lilies and peacock feathers within the decoration – both potent symbols of Aestheticism.

The key features of Talbert’s drawings of interiors, several of which appeared in *Gothic Forms*, were their lightness and elegance. The sturdy and massive quality of some of his furniture, while still evident in several of the larger tables and chairs, was replaced by slimmer and more delicate forms in items such as the tall drawing room sideboards. And although he laid considerable emphasis upon surface decoration, favouring quite bold Gothic and Anglo-Japanese style patterns for upholstery, curtains, wall-hangings and painted covings and ceilings, the overall effect appeared less ponderous and heavy than in other reformed Gothic interiors. Indeed, his greatest strength was in devising a look that was decorative but practical, and his personalised version of the Aesthetic and Old English styles proved immensely popular with the professional classes and in the more Artistic middle-income homes.

Large numbers of Talbert’s designs were reproduced in architectural and design journals, and his work was admired not just in England but also abroad. *Gothic Forms* was published in the United States in 1873 and exercised considerable influence on cabinet-makers in New York and the Midwest. Daniel Pabst in Philadelphia, Kimbel & Cabus of New York, and Mitchell & Rammelsburg of Cincinnati were three of several firms who adapted his work for the American market and Talbert’s designs remained influential long after the Gothic style ceased to be fashionable. A book entitled *Fashionable Furniture*, containing a hundred previously unpublished plates by Talbert, was published in New York in the 1880s, and its contents underlined the versatility of his enduring talent and skill.

Biography

Bruce James Talbert. Born in Dundee, Scotland, in 1838. Apprenticed as a carver before entering the office of the Dundee architect Charles Edwards. Moved to Glasgow and worked in the architectural office of W.N. Tait, 1856; joined the practice of Campbell, Douglas and Stevenson by 1860. Awarded a medal for architectural design, 1860, and the Edinburgh Architectural Association medal for drawing, 1862. Married Amy Adkins, 1874. Worked for Francis Skidmore’s Art Manufacturers, Coventry, c.1863; based in London designing

furnishings for a number of firms including Holland & Sons by 1866. Ran his own studio in Dundee for a brief period in the 1860s, then returned to London c.1869. Set up independent design practice by 1873; established as a leading commercial designer supplying designs for furniture, textiles, metalwork, wallpaper and stained glass to many leading British manufacturers by the mid-1870s. Published the influential books *Gothic Forms* (1868) and *Examples of Ancient and Modern Furniture* (1876). Designs for furniture and interiors exhibited at the Royal Academy, London, between 1870 and 1876; examples of his work shown at International Exhibitions in London 1862, Paris 1867 and 1878, and Vienna 1873. Died a chronic alcoholic, in London, 28 January 1881.

Selected Works

Designs and examples of Talbert’s furniture (including the *Juno* cabinet), textiles, and wallpaper are in the Victoria and Albert Museum, London. Additional examples of furniture are in the City Art Gallery, Manchester, and the Cecil Higgins Art Gallery, Bedford; textiles and wallpapers are in the Whitworth Art Gallery, Manchester; and metalwork in Birmingham Museum and Art Gallery. Talbert’s registered designs are in the Public Records Office, Kew.

Talbert supplied designs for many leading cabinet-makers including Gillow & Co. (*Pet* sideboard, 1872), Jackson & Graham (*Juno* cabinet, 1878), Doveston, Bird & Hull, Collinson & Lock, Holland & Sons, and Marsh, Jones & Cribb. He designed wallpapers for Jeffrey & Co. from 1878; metalwork for Skidmore’s Art Manufacturers Co., Cox & Sons, and Coalbrookdale Co.; carpets for Brinton & Co., and Templeton’s; textiles and embroideries for Cowlshaw, Nicol & Co., Barbone & Miller, and Warner & Sons.

Tapestries

Tapestries are among the highest forms of textile art. They have been used to decorate large homes and other buildings for many centuries, and were popular on walls long before framed paintings, small pieces of needlework, or wallpaper.

A tapestry, strictly defined, is a pictorial or abstract weaving done in plain weave with a clearly defined design formed by the weft threads. There is a tendency to refer to any pictorial wallhanging, particularly canvaswork, as a "tapestry", but this is not correct. Tapestry is a type of hand weaving, and may have many uses, but it is best known as a wall decoration.

Traditional tapestry is woven either on a vertical high-warp loom (*haute lisse*) or a horizontal low-warp loom (*basse lisse*). The design pattern, or cartoon, is drawn in reverse on paper which is laid under the low-warp loom, and the weaver faces the cartoon while working from the backside of the tapestry. High-warp weavers have the cartoon behind them, and sometimes mark the outlines of the design on the warp threads. A mirror is used to check the progress of the right side, which faces away from the weaver. The colored weft, or horizontal, threads with each color on its own bobbin are woven in and cross the front only where the individual colors are used in the design. The tapestry is wound on a roller as the work progresses. An open slit may be left between adjoining colors, or the adjoining weft threads may be interlocked. Slits are usually sewn together when the tapestry is finished. It is easier to weave with the tapestry design cartoon laid sideways, but some modern weavers weave their patterns from bottom to top. However, large tapestries hung with vertical warp threads may sag on the wall. The distinct ridges formed in the direction of the warp threads generally lie horizontally when the tapestry is hung, catching the light in such way that the design is unified.

Wool is generally used for warp threads, but linen, cotton or silk can be used. Wool, silk, or sometimes modern synthetics are favored for the weft threads, but in the past gold and silver thread were also woven in, thereby encouraging the destruction of the tapestries by later generations who burned them to recover the metal. Silk threads in old tapestries that have survived to the present have deteriorated more severely than wool. Also, many of the old dyes have faded on the surface, even though the backs often show bright colors.

The earliest tapestry fragments have been found in the Egyptian tombs of Tuthmosis IV and Tutankhamun, dating from c.1450 BC–1330 BC. There is some evidence to suggest that tapestry weaving originated in Syria, however, and reached Egypt through the trade routes. Decorative tapestries were used throughout the Mediterranean countries through the Roman period. By the 4th and 5th centuries AD pictorial tapestries were popular with both the Romans and Egyptians. Alexandria was a center of manufacture, employing Greek weavers. Interest in tapestry diminished in Europe after the fall of the Roman Empire, and survived only in monasteries. Fine linen tapestry weaving was also practised in Egypt by the Coptic Christians in the 6th and 7th centuries AD. Surviving Coptic fragments are primarily clothing, but do include some wallhangings.

The Chinese of the Song dynasty (960–1279) produced a silk tapestry called *kesi*, or *k'ossu*, literally "carved silk",

featuring bird and flower motifs. They had further developed the techniques used in the Tang dynasty (618–907) when silk tapestry weaving was first practised in China. Early tapestries, woven as narrow strips, were used for book bindings and scrolls. Later forms of *kesi* used as hangings were larger and featured naturalistic scenes in imitation of paintings. Succeeding dynasties of imperial China produced tapestry for a great variety of household items, including hanging room-dividers, folding screens, bedding, and curtains.

Pre-Columbian Nasca and Tiahuanaco cultures in Peru and Bolivia, using wool from native animals of the camel family such as alpacas, had a highly developed style of tapestry weaving with very complex designs as early as the first millennium BC, but the surviving weavings, found in graves, were used mainly for clothing. The Pueblo and Navajo people in North America use the tapestry weave for their blankets and rugs, both of which have been used as decoration on floors and walls by purchasers from outside the tribes.

The European tapestry industry developed in the 11th century after some activity in Spain by Moorish weavers beginning in the 8th century. Early tapestries were woven in Poitiers, Paris, and Arras for the French and Burgundian nobility, and had simple motifs adapted from manuscripts. Pictorial tapestries from cartoons were made after 1350, and often included gold and silver thread. Arras was the main center of production, with the result that high-quality tapestry was often referred to simply as "arras".

Tapestries soon became an impressive medium of display for owners who carried them from castle to castle as portable furnishings to decorate and insulate large bare stone walls and provide privacy around beds. Few of these survived the wear and tear of this kind of treatment. Carried around on campaign in the baggage of their owners, they often became war booty. Many were destroyed by rats and moths, while others were sometimes burned to recover gold thread when their usefulness was over.

Many tapestries were sized to fit specific walls and passageways in the house of the owner. Small tapestries, or portières, were specially woven to hang over doorways. When the tapestry was moved to another house, the fit was sometimes improvised by running the hanging around corners or bunching the hanging hooks to take up excess length. In some cases tapestries were cut to fit the space without regard to the destruction of the design.

At first there was no attempt to match tapestries to furniture in the room. However, by the early 15th century furniture upholstery, cushions, and bedhangings were made to match the wall tapestries in sets called "chambers".

In the mid-15th century Arras tapestry production declined, and Tournai became the main center of tapestry production. Pasquier Grenier, a merchant of Tournai, owned a number of tapestry cartoons in the 1440s, and farmed them out to independent workshops. Tapestries were produced in sets that told a narrative story through a series of pictures. The most famous of these was a history of the Trojan War, which was produced in many sets for noble patrons. Four tapestries from one of these sets are now in the Victoria and Albert Museum in London.

New manufactories were established in Lille, Bruges, and Brussels. A tapestry guild that guaranteed high material quality

Tapestries: *La Dame à la Licorne*, c.1490–1500

Tapestries: Presence Chamber, Hardwick Hall, Derbyshire, late 1590s

was formed in Brussels in 1447, and by the end of the century Brussels dominated the high-quality market. Production of new cartoons was controlled by the painters guild of St. Luke in Brussels.

Early French tapestry designs had large stylised figures on decorative backgrounds. By the end of the 14th century there was increasing interest in narrative and naturalistic detail, leading to designs with pockets of narrative all over the surface separated by areas of stylised foliage and rocks. In the 15th century scenes with elaborately costumed figures were arranged all over the surface. Backgrounds were composed of *mille fleurs*, or thousand flowers, designs. The most famous of these, a set of six tapestries representing the five senses, titled *La Dame à la Licorne* (The Lady and the Unicorn), c.1490–1500, was originally in the Château de Boussac and is now in the Musée de Cluny in Paris. In these tapestries the lady and her handmaiden, flanked by a lion and unicorn, are presented on an island of flowers and trees set against a predominantly red contrasting background of flowers and animals. Most of the colors have survived in nearly their original brilliance. These tapestries have a delicacy and decorative quality that became lost when historical narrative in a more painterly style took over.

A crucial factor in the development of this style was the despatch of Raphael's cartoons for the *Acts of the Apostles* from Rome to Brussels where they were reproduced in 1517–19 as a sumptuous cycle of hangings for the Sistine

chapel. They caused a revolutionary change in design, and introduced tapestry weavers to the developments of the Italian Renaissance. Bernart van Orley and other Brussels designers adopted a style combining Flemish narrative with Italian perspective and monumental figures. Painters came to dominate the arts, tapestries increasingly resembled paintings of the period, and weavers were forced to copy cartoons more exactly than in the past. Color palettes were increased from about twenty colors to more than 300 shades, not all of them color-fast.

By the 16th century tapestries were major elements of the competitive displays of the European courts in the efforts of monarchs and nobility to impress their subjects and one another. Annual merchants' fairs were held at Antwerp and Bergen-op-Zoom, and tapestries of varying quality were exported all over Europe. The Swedish king Gustavus I had tapestries made for the royal palace in Stockholm from 1523 to 1560 by weavers from Flanders. The large fruit, leaves, and flower patterns of these tapestries inspired local Swedish weavers to make their own Flamsk tapestries incorporating somewhat naive patterns of fruit, flowers, animals, castles, and figures in Swedish dress.

Religious persecution and civil war in the Netherlands disrupted production in the latter part of the century, and the Antwerp market was looted by Spanish troops in 1576. Weavers went to Holland, Germany, and other countries. Delft and Paris profited from this dispersal of weaving talent by

Tapestries by François Boucher, at Osterley Park, Middlesex

establishing their own industries using Flemish weavers. James I established a tapestry factory at Mortlake near London in 1619 that equalled work done in France and Flanders, also staffed by Flemish weavers.

After laws were passed in the 17th century by the Flemish tapestry guilds to prevent further emigration of weavers, the medium-quality tapestry market continued to be dominated by Brussels. Flemish artists such as Rubens and Jordaens furnished cartoons for dramatic designs with large borders and restricted landscapes.

In 1667 the Paris tapestry workshops were amalgamated at Gobelins, where they were joined by craftsmen from other industries. Charles Le Brun became the director of the Gobelins factory, which produced the finest tapestries of the time. However, they were reserved for the exclusive use of the king, Louis XIV. Tapestries for the commercial market in France came from Beauvais, which specialized in tapestry upholstery, and from Aubusson. Antwerp and Oudenarde continued to supply medium- and cheap-quality tapestries to people of all social levels in the rest of Europe. Even farmers and tradesmen bought them to use as bedcovers. By the end of the 17th century tapestries were a permanent part of room furnishings, sometimes being considered as mere backdrops on the wall. Some suffered the indignity of having pictures nailed to the wall directly through the tapestry.

During the first half of the 18th century the success of the Gobelins tapestries inspired the establishment of new workshops in Madrid, Munich, Naples, Rome, and St. Petersburg that catered to wealthy patrons. Several independent workshops in London had moderate success in the English market.

The Brussels workshops had something of a renaissance in the 17th and early 18th centuries. The most famous of these was the workshop of the widow Catherine Geubels, who carried on the business of her late husband, Jacob. Designers Lambert de Hondt and Jan van Orley produced cartoons with historical and mythological themes that suited late Baroque taste. In the Gobelins and Beauvais workshops the pastoral designs of Jean-Baptiste Oudry and François Boucher were popular during the reign (1715–74) of Louis XV.

By the late 18th century demand for tapestry was declining because of increased competition for wall space from paintings, mirrors, and wallpaper. Houses had better heating and more furniture so the need for tapestries to provide insulation or to serve as the principal decoration became less pressing. Given that tapestries were extremely expensive, the fashion moved from hangings to upholstery. Some of the large houses continued to commission tapestries, but often they were confined to just one room where the furniture was upholstered to match. In addition money for luxuries was scarce in Europe after the American and French revolutions.

Factories in London and Brussels were closed by 1800. Gobelins and Beauvais continued to produce tapestries in the Neo-Classical style until the 1790s, when the French Revolution destroyed their clientele. After the Revolution the workshops were forced to alter their output for political reasons. The Aubusson factory, not as seriously affected by the Revolution, continued to produce upholstery and tapestry carpets.

In the first half of the 19th century tapestry weaving declined in quality, and production was limited to rugs, uphol-

stery, and copies of old tapestries. Many of the old wall tapestries were destroyed, while the popular fashion was for walls covered in patterned wallpaper. The little tapestry that was produced was used on small furniture pieces. In an attempt to revive interest in England late in the century, the Windsor Tapestry Factory, under royal patronage with French weavers, was established in Berkshire in 1876. It was not a success and closed in 1890. Some of the Windsor tapestries were displayed at the World's Columbian Exposition in Chicago in 1893, inspiring William Baumgarten to set up a workshop in New York in 1893 to cater to increasing interest in the American market. It was partially staffed by weavers from Windsor headed by Jean Foussadier and members of his family. The Baumgarten workshop initially concentrated on chair seats in floral patterns and then moved on to "collections" or sets of firescreens, upholstery, wall hangings, and other furnishings made to order for specific settings. The workshop later moved to Williams Bridge, New York, where it closed in 1912 after a decline in business and competition from the Aubusson Looms established in New York in 1908 by Albert Herter.

Further interest in tapestry during the Arts and Crafts movement in England was generated by William Morris when he founded the Merton Abbey Tapestry Workshop in 1881. Morris had become interested in tapestries as a student and had a preference for Flemish hangings of the 15th and early 16th centuries. He was self-taught and set up his first tapestry loom at his London home, Kelmscott House, in 1877. His first tapestry, titled *Acanthus and Vine* or, popularly, *Cabbage and Vine*, was completed in 1879. Morris and his chief designer, Edward Burne-Jones, produced tapestries in the neo-Gothic style with mythological, biblical and literary themes. The workshop did mainly commissioned work for private homes, and although it was not in the furnishings mainstream during the Victorian period, it had considerable influence. It inspired the establishment of the Herter workshops in New York in 1908 and the Dovecot Studios, founded by the fourth Marquess of Bute in Edinburgh in 1912, to weave tapestries for his own homes and castles. Directed by Sax Shaw, Dovecot employed several weavers from Merton Abbey and obtained much of Merton Abbey's tapestry weaving equipment when Morris & Co. closed in 1940. Dovecot continues to produce and exert great influence on 20th-century tapestry design.

Changing tastes and smaller living spaces have restricted demand for tapestries in the 20th century, but there is a steady market in both antique and modern tapestries. From 1933 through the 1940s the French painter Jean Lurçat revived tapestry weaving at Aubusson using abstract and decorative motifs rather than painterly designs. Lurçat's colorful fantasies using a reduced color palette of about 45 colors made full use of flat woven perspective in much the same way as modern Balinese batik designs. Beginning in 1916, he experimented with tapestry cartoons that were executed by his mother in cross stitch. He worked with and inspired a generation of studio weavers who generally produced one-off designs, often by commission. In addition he was responsible for launching the tapestry Biennale exhibitions at Lausanne sponsored by the International Centre for Ancient and Modern Tapestry, founded in 1961.

Modern weavers often work from their own designs, and may or may not use a cartoon. Many tapestries are woven by

hand in small workshops or individual studios, and designs are often abstract or geometric with large blocks of color or are intricately shaded pictorials. Often weavers study traditional weaving from the past and from ethnic cultures for design ideas and techniques, but modern designs are tailored for a flat perspectiveless surface emphasizing interplay of colors. Weavers do not attempt to copy paintings as they did in the past.

Large tapestries are frequently commissioned for public buildings and commercial establishments such as hotels. Private homes, particularly those built in the Contemporary style with expanses of plain wall and few or no mouldings, also sometimes have tapestries hung along with other kinds of wall-hangings for color and decoration.

Another 20th-century development has been the increasing popularity of reproduction tapestries and tapestry cloth, machine woven on computerized Jacquard looms. While this is not true tapestry in the sense of being handwoven, it has a similar appearance and is used as a relatively inexpensive mass-produced tapestry substitute for wallhangings, cushion covers, and numerous small items. Designs are usually intended to be in an antique style, and often copy portions of old tapestries and prints.

Principal Workshops and Manufacturers

The main tapestry manufactories are: in Britain, Mortlake Tapestries (1619–1703), Merton Abbey Workshop (1881–1916, 1922–50), and Dovecot Studios (1912–present); in France, Arras ateliers (1300s–c.1450), Tournai ateliers (1400s–c.1550), Aubusson workshops (1400s–present), Gobelins workshops (1663–present), and Beauvais workshops (1600s–1930s); in the Netherlands, Brussels ateliers (1400s–1600s), Oudenarde workshops (c.1450–c.1660), and Bruges ateliers (1500s); in Sweden, the Royal Workshops, Stockholm (1500s); and in the United States, William Baumgarten (1893–1912), Aubusson Looms / Herter Looms (1908–34), and the Edgewater Tapestry Looms (1924–33).

Further Reading

The literature on Tapestry is vast and historical surveys appear in most of the catalogues of major museum collections; these also include scholarly entries on individual items. Göbel's monographs on Dutch, Italian and German tapestries represent standard reference works on these subjects. A recent English-language survey is Phillips 1994 which also includes a guide to museum collections and an annotated bibliography. Additional bibliographical references can be found in Campbell 1993.

Tapiovaara, Ilmari 1914–

Finnish designer of interiors and furnishings

The work of the interior designer Ilmari Tapiovaara, one of the leading figures in the Finnish furniture industry between the late 1940s and the early 1970s, has been largely overshadowed in the eyes of the world by the achievements of his famous compatriot, the architect Alvar Aalto. The fact that there has never been the same glamour associated with his name should not belittle his achievements, however. In a quiet, undemonstrative way Tapiovaara's furniture has had a major impact on post-war interiors, particularly public buildings. His chairs, especially his practical everyday seating for schools and colleges, is so ubiquitous and so familiar that it tends to be taken for granted. Because it is unobtrusive and works well, it does not always draw attention to itself, but its very anonymity is a measure of its success.

In addition to Aalto, by whom Tapiovaara was strongly influenced in his youth, useful comparisons can also be made between the work of Tapiovaara in Finland and his contemporary, Arne Jacobsen, working in partnership during the same period with the firm of Fritz Hansen in Denmark. However, unlike Jacobsen, who worked with a single company, and whose name, as a major architect, was used as a marketing ploy to promote his designs, Tapiovaara worked with several different, less high-profile furniture companies over the years, and his furniture was advertised and distributed in a more

anonymous way. For this reason he never achieved the same kind of celebrity status as his Danish colleague, and although he played a key role in the development of the plywood stacking chair and his *Domus* chairs became almost as common as Jacobsen's *Ants*, they have tended to be considered ordinary and unexceptional by comparison, and outside Finland Tapiovaara's significance as a designer has been undervalued.

Tapiovaara embarked on his career during the late 1930s, at a time when Aalto's laminated wooden stools and chairs were enjoying international acclaim. His earliest chair designs were directly influenced by Aalto's cantilevered laminated wood structures. During these early years Tapiovaara benefited directly from being associated with Aalto: as a student he gained valuable technical experience at the Korhonen factory where Aalto's furniture was produced, for example, and later he worked for a brief period at the London headquarters of Finmar, the British company responsible for the marketing of Aalto's furniture in the UK, where he was employed to organise a promotional exhibition of Aalto's furniture.

While still a student at the Institute of Crafts and Design in Helsinki, Tapiovaara worked for six months in Le Corbusier's office in Paris and he would have been impressed by Le Corbusier's commitment to Functionalism. Like many designers trained during the inter-war period, Tapiovaara was strongly influenced by Modernism, and in particular by the new ideas about architecture and industrial design that had emerged from the Bauhaus during the late 1920s and early 1930s. This ideology was to shape his practical down-to-earth approach to furniture design, and his desire to create good quality, well-designed, compact, functional furniture suitable for small homes and affordable to those on low incomes. He was not interested in the luxury market; he was fully committed from the outset to mass production. Functionalism was at the root of Tapiovaara's impulses as a designer, and he was determined to ensure that his furniture would not only be comfortable and practical from the user's point of view, but that it would also be practical from a technical point of view in terms of its construction.

On returning to Finland from France in 1938, Tapiovaara's first job was in the design department at the Asko furniture factory. Here he met his future wife, the interior designer Annikki Hyvärinen, and together they worked on the designs for the Asko stand at the Finnish Housing Exhibition of 1939. The war brought Tapiovaara's early career with Asko to an end, however, and he moved on in 1941 to another firm, Keravan Puuteollisuus Oy, with whom he worked for the next decade. During the war years very little furniture production took place, but Tapiovaara supervised the modernisation of the factory's buildings and machinery so that they would be immediately ready for the resumption of full-scale manufacturing after the war. In 1946 he was presented with the challenge of designing the furniture and the interiors for the new *Domus Academica* designed by Pauli Salomaa, including dormitory and sitting room furniture for 750 students.

It was out of this project that the classic *Domus* stacking chair design evolved, a chair that was so successful that it remained in production for several decades. With this design, Tapiovaara successfully mastered the practical difficulties of producing a strong, lightweight chair which could be stacked, but which could also be transported flat-packed. Promotional

campaigns at the time drew attention to these characteristics. With its short arm rests, its solid wooden legs, and its thin steam-pressed plywood seat and seatback screwed to its frame, the *Domus* chair was so simple to construct that it could be sent out by the manufacturer in knock-down form in its component parts to be put together by the retailer. Because of the reduction in bulk during transportation, this meant it was ideal for export. During the 1950s it enjoyed widespread success internationally; manufactured in Finland by Asko, it was also produced under licence by various manufacturers in different countries, such as Knoll in the USA and Morris of Glasgow in the UK, where it was variously known as the *Finnchair* or the *Stax* chair. In terms of its importance in design historical terms, it should be considered on a par with Charles Eames's moulded plywood LCW and DCW chairs of 1946 produced by Herman Miller in the USA, Robin Day's *Hillestak* chairs dating from 1951 produced by Hille in Britain, and Arne Jacobsen's *Ant* and *Series 7* chairs dating from 1952 produced by Fritz Hansen in Denmark.

It was as a result of an even larger college commission, this time to furnish the 1000-bed Tech Student Village designed by Kaija and Heikki Siren, that Tapiovaara's second major chair design was developed, the *Lukki* or *Daddy Long Legs* chair, manufactured by Lukkiseppo from 1951, and produced in a number of different variant forms later in the decade. This spindly chair, with its compressed oval plywood seat and seatback and its fine spidery steel rod legs, typified the new "Contemporary" aesthetic of the 1950s. Such furniture was well-suited to the minimalist clean-lined open-plan interiors of the day which demanded more lightweight furniture than had been available before the war. Similarly playful, but perhaps a little less practical because of its protruding back legs, was the *Kongo* reclining chair of 1954 produced by Asko, the frame of which was made from either steel rod or wood, with stretched canvas or stretched webbing upholstery. The *Tale* stool produced by Asko from 1953 was different again, being three-legged with a rounded triangular plywood seat and a solid wood understructure.

Tapiovaara's designs over the years were remarkably varied: he was by no means limited to a single aesthetic or to the use of a single material. He also worked with several different manufacturers concurrently, producing designs to suit their particular manufacturing strengths. In some of his chairs from the second half of the 1950s, such as the *Aslak* of 1957 for Asko and the *Wilhelmina* of 1959 for Schauman, he returned to using thicker bent laminated wood for the framework of his furniture, and he also experimented with different types of metal structures. In addition to his work as a furniture designer, Tapiovaara has contributed to the definition of the Scandinavian Modern style through the design of household accessories such as lighting and cutlery, as well as by pursuing his career as an interior designer.

LESLEY JACKSON

Biography

Yrjö Ilmari Tapiovaara. Born in Helsinki in 1914. Apprenticed with furniture manufacturers in Helsinki, 1933–35; studied interior design, Central School of Industrial Design, Helsinki, 1933–37; attended the University of London, 1936–37; apprentice in the studio of Le Corbusier, Paris, 1937. Married 1) interior designer Iris

Annikki Hyvarinen, 1939 (died 1972): 3 children; 2) Riitta Kurikka, 1972. Artistic director, Asko furniture manufacturers, Lahti, 1938–40; founder and designer, Keravan Puuteollisuus Oy furniture firm, Kerava, 1941–50; freelance designer, working for Marva Production, Knoll International, Thonet, Edsbyverk, Asko Konsern, Lukkiseppu, Oy Skanno Ab, Laukaan Puu, Hackmann Oy, Stockmann Orno and others, in Helsinki, from 1951. Head, 1950–52, and chair of interior design department, 1953–56, Central School of Industrial Design, Helsinki; visiting professor, Illinois Institute of Technology, Chicago, and Art Institute of Chicago, 1952–54, and University of Technology, Helsinki, from 1965. Received numerous prizes and awards including the Gold Medal, Milan Triennale 1951, 1954, 1957 and 1960, and American Interior Design Award, New York, 1963. Honorary Royal Designer for Industry, Royal Society of Arts, London, 1964.

Selected Works

Interiors

- 1946 Domus Academica, Helsinki (interiors and furniture; building by Pauli Salomaa)
- 1950 Tech Student Village, Helsinki (furniture and interiors; buildings by Kaija and Heikki Siren)
- 1954 Olivetti Showroom, Helsinki (interiors)
- 1957 Corvair and Caravelle aircraft interiors for Finnair
- 1973 Intercontinental Hotel, Helsinki (interiors)

Tapiovaara's furniture included the *Domus* stackable chair (1946), the *Lukki* chair (1951), the *Tale* stool (1953), the *Kongo* reclining chair (1954), the *Aslak* chair (1957), the *Wilhelmina* chair (1959), and the *Kiki* upholstered stackable chair (1960). His household accessories included the *Polar* stainless steel cutlery range (1963), and he also designed radio and stereo equipment for Centrum (1970–74) and wall paintings and tapestries.

Tatham, C.H. 1772–1842

British architect and designer

A committed and uncompromising advocate of the severe Neo-Classical style, Charles Heathcote Tatham exercised a significant influence on British taste during the first decades of the 19th century. His architectural works included several notable picture galleries, sculpture galleries and mausolea employing exaggeratedly simple forms and designed in an almost brutally austere classical style. His designs included numerous drawings of furniture and decoration based on antique examples, which were engraved and published in book form and which enjoyed huge success, appearing in several editions in England and abroad. And through his work, first for the architect Henry Holland, and later with the leading cabinet-makers John Linnell and Thomas Tatham, he made an important contribution to the development of contemporary decoration and furniture.

Born in London in 1772, Tatham was employed briefly as a clerk by the architect Samuel Pepys Cockerell in 1788. A year later he moved on to work as a draughtsman in the office of Henry Holland where he participated in some of the architectural and interior detailing at Carlton House and Woburn Abbey. In 1794 Holland sent Tatham to Rome to complete his architectural studies. He remained there for two years and met many of the leading artists and cognoscenti of the day including Antonio Canova, Angelica Kauffman, Sir William Hamilton, and the 5th Earl of Carlisle, who was to become one of his most important patrons. During this period Tatham also acquired for Holland a large number of antique Roman fragments and commissioned several ornamental objects such as candlesticks, vases and candelabra from contemporary Roman designers and stonemasons. Many of Tatham's drawings of antique decorative motifs and contemporary ornament were published on his return to England in his *Etchings of Ancient Ornamental Architecture* of 1799–1800. A companion volume, entitled *Etchings representing Fragments of Grecian and Roman Architectural Ornaments*, was issued in 1806. In addition to examples of antique furniture, these books include illustrations that represent a remarkable synthesis of the findings of 18th-century excavators at Pompeii, Herculaneum, Tivoli and Rome. Their intention was to provide decorative models for cabinet-makers and other craftsmen working at Holland House and elsewhere.

The influence of international Neo-Classicism is clearly evident in Tatham's published drawings and in his designs for furnishings and interiors. His taste ran to unadorned mass, and the scale, refinement and classical purity of his designs contrasts sharply with the more eclectic interpretation of antique examples favoured by contemporaries such as John Soane, John Nash and James Wyatt. Not surprisingly, his preferred models were Greek and, in a letter he wrote to Holland from Italy in 1795, he declared "surely no argument can be that Roman architecture either for adaptness, beauty and proportion exceeds the Grecian ... The Parthenon ... will I believe in the opinion of most of our professors rank higher ... than all the triumphal arches or even temples that the Romans ever erected." The influence of Greek forms was

apparent in the simple monumentality that pervades his interiors.

One of Tatham's first projects on his return to England was for Lord Carlisle, who commissioned him to remodel the interior of the west wing at Castle Howard as a sculpture gallery and museum. Tatham also designed a massive Egyptian desk (c.1800) and *ormolu* chandeliers (1801) for another part of the house. The southern half of the Sculpture Gallery was executed between September 1801 and July 1802; the central rotunda and northern section were added between August 1811 and September 1812. Contemporary illustrations, published in Tatham's *Gallery at Castle Howard* (1811) show massive Egyptian-style chimneypieces, heavy Roman tables and monumental pelmets and hangings.

Between c.1803 and 1806, Tatham also provided a Picture Gallery at Cleveland House, St. James's, for the 2nd Marquess of Stafford. A room of singular austerity, the gallery was enlivened only by two large diagonally coffered apses, one at each end. The Cleveland House commission was followed shortly afterwards by work at Stafford's country house, Trentham, where Tatham added two wings to the south front, a fountain, green house, bridges, lodge and a large mausoleum (1807–08). Only the mausoleum survives, exhibiting an extreme and uncompromising form of Neo-Classicism that has primitive overtones and that appears markedly bleak and gaunt.

The Picture Gallery for Lord Yarborough, at Brocklesby Park, Lincolnshire (1807) consisted of a single storey addition to the west end of the house. It has since been entirely remodelled, but its original appearance is recorded in a series of elegant engravings drawn by Henry Moses and published by Tatham in 1811. These show the decoration to have been noticeably lighter in character than the monumental forms used in the Gallery at Castle Howard.

During a period when an increasingly eclectic approach to design sources was becoming more popular, the idealism, authority and single-mindedness of Tatham's vision of the classical past rapidly became outmoded. It isolated him increasingly from both patrons and other designers for whom less rigorous and more flexible sources were preferable. By the 1830s Tatham's practice had declined and he was forced to sell the house that he had built for himself in Alpha Road, St. John's Wood, together with his collection, in 1834. Yet the importance of his work was widely recognised and Wyatt Papworth's *Dictionary of Architecture* (1852–92) claimed that "to him, perhaps more than any other person, may be attributed the rise of the Anglo-Greek style which still prevails."

BRIDIE DORNING

Biography

Charles Heathcote Tatham. Born in Westminster, London, 8 February 1772. Educated at Louth grammar school, Lincolnshire; received his early artistic training from the cabinet-maker John Linnell. Married in 1801: 10 children, including the sculptor and painter Frederick Tatham (1805–78). Clerk in the London offices of Samuel Pepys Cockerell (1753–1827), 1788; draughtsman in the office of Henry Holland (1745–1806) from 1789. Sent to Italy by Holland to record and collect antiquities, 1794–96; drawings and additional designs published as *Etchings*, 1799; published additional volumes of designs in the early 1800s. In practice as an independent architect from 1798; financial difficulties forced him to sell his house and collection,

1834; appointed Master of Holy Trinity Hospital, 1837. Died in 1842.

Selected Works

A collection of letters and drawings sent by Tatham to Holland while he was in Rome is in the Victoria and Albert Museum. Additional drawings are in the Royal Institute of British Architects and Sir John Soane's Museum, London. A list of Tatham's architectural commissions appears in Colvin 1995; examples of his furniture can be seen at Castle Howard, Yorkshire.

Interiors

- 1800 Stoke Edith, Herefordshire (drawing room): Hon. Edward Foley
- 1800–02 Castle Howard, Yorkshire (sculpture gallery and museum, and some furniture): 5th Earl of Carlisle

Terragni, Giuseppe 1904–1943

Italian architect

Based in Como in Northern Italy, Giuseppe Terragni was the greatest of the Italian inter-war modern architects, but critical evaluation of his work has been made difficult both by the brevity of his career and by his commitment to the ideology of Fascism. Terragni graduated from the School of Architecture in

Milan in 1926; he was drafted into the army in 1939, and died four years later following action on the Russian front. His creative period was therefore not much longer than a decade. His commitment to Fascism lasted throughout this period, but the effect upon his work was not overly constricting. While the trend in Nazi Germany was to sanction one official style of architecture, the authorities in Italy were more tolerant and various directions were developed by Italian Fascist architects. This variety was evident both in Terragni's work and that of his contemporaries, but his skill and imagination as an architect and designer were unrivalled by his peers.

Terragni's first major commission, the Novocomum apartment building in Como, was completed only a year after he had completed his studies. The building occupies a corner site, and its use of curved solid floors alternating with curved glass storeys, all capped by a cantilevered rectangular top floor, is directly inspired by the work of the Moscow Constructivists, a consideration that suggests that architectural style and political creed are not as closely woven as some historians would like to think. The overtly propagandist nature of Terragni's "Room of 1922", however, designed in 1932 to celebrate ten years of Fascism, makes the post-war hostility to his work more explicable. But the architecture and interiors of his Casa del Fascio transcends bald political labels.

The Casa del Fascio in Como is Terragni's masterpiece. The exterior has a regular gridded frame as minimalist as anything designed by Mies van der Rohe, with two solid bays at one side giving an exquisite sense of balance and proportion to the façade. The interior is planned around a court, illustrating an early example of what would be called an "atrium" in High-Tech office buildings of the 1970s and 1980s. This court is flooded with light and surrounded by offices, a concept that was further developed in the Ford Foundation Building in Manhattan designed by Skidmore, Owings and Merrill some 25 years later. The Como court introduced a sense of quality and generosity that was new to office buildings of the 1930s. Italy is the land of marble, and this material is used lavishly to provide a feeling of luxury and permanence. The offices themselves are somewhat dull, although they are enlivened by Terragni's light fittings and by his heavy glass-topped tables.

The court breaks through on the main façade behind the gridded frame which faces the great urban square of Como with the city's Cathedral and theatre. There was some political idealism in wishing to expose the interior to public view, an openness taken to the extreme on the ground floor where sixteen electrically operated doors open together to permit a phalanx of Blackshirts to march in and out. The only criticism that can be made of the architecture is that its very perfection is somewhat lifeless and lacking in emotional depth. Reyner Banham said that it could be described as "the machine aesthetic at its most heartlessly elegant" and admittedly the profusion of marble is chilling to North European eyes. Nevertheless it has enabled the building to survive years of use and misuse.

After the war the building was renamed the Casa del Popolo and became the local headquarters for very different political parties, including Communist and Socialist groups. The fact that such a change of use needed only a change of signage is a convincing argument that great architecture may be apolitical.

The admiration for this building will outlast its unattractive political beginnings.

In more lighthearted mood, Terragni designed a school named after the celebrated Futurist architect, Antonio Sant'Elia, who had been a native of Como. The Asilo Sant'Elia School has all the warm human touches that the Casa del Fascio lacks – it is single storey, open to the outdoors and was designed with great consideration for the needs of the children. It shares with the Casa del Fascio the column and beam architecture of classicism stripped down to its minimum geometrical forms. Such stripped classicism had by this time become the official architecture of Mussolini's Italy, but at the Asilo Sant'Elia the style is deployed with a playfulness and charm that are wholly appropriate to the design of a school.

Terragni's last building, the Casa Giuliani Frigerio, built in 1939, shows him moving away from the generally accepted Mussolini style and being influenced by buildings in Northern Europe. This five-storey apartment building near the lake in Como has much more adventurous, if less perfectly balanced, façades than his previous buildings. The frame is played down and the design is conceived as a series of planes which do not quite meet, a clear debt to Theo van Doesburg and the imagery of the De Stijl movement of fifteen years earlier. With this building Terragni was clearly developing a new richness. It is as if the architect, at the height of his powers, has discovered the magic of Rietveld's Schröder House and felt the need to change direction. Unfortunately, however, war intervened before he could completely digest the new idiom and make it his own.

JOHN WINTER

Biography

Born in Meda, near Milan, 18 April 1904, the son of a mason. Attended Milan Polytechnic School of Architecture, 1921–26. Founder-member of Gruppo 7, with Ubaldo Castagnoli, Luigi Figini, Gino Pollini, Guido Frette, Sebastiano Larco, and Carlo Rava, 1926; also founded MIAR (Movimento Italiano per l'Architettura Razionale) with others, Rome, 1927. Worked in private practice, with his brother Attilio, Como, 1927–39; collaborated with Pietro Lingeri on several projects in Milan, 1933–37. Designed furniture and fittings from c.1928. Enlisted in the Italian army and served on the Greek and Russian fronts, 1939; repatriated to Italy 1943. Wrote several articles on architecture and was founder-editor, with Ciliberti, Lingeri and others, of *Valori Primordiali* magazine, Como, 1937. Died in Como, 19 July 1943.

Selected Works

Interiors

- 1927–28 Novocomum Apartment Building, Como (building, interior and some furniture)
- 1930 Biennale, Monza ("Sartoria Moderna" furniture and interiors)
- 1930 Vitrum Shop, Como (façade, interiors and fittings)
- 1930–35 Post Hotel, Piazza Volta, Como (building, interiors and some furniture)
- 1932 Rivoluzione Fascista Exhibition, Rome (Sala del'22; interior and furnishings)
- 1932–36 Casa del Fascio (now Casa del Popolo), Como (building, interiors and furniture)
- 1933 Artist's Lakeside House, Triennale, Milan (building, interiors and furniture; with Gruppo di Como)
- 1933–35 Rustici House, Milan (building and fittings; with Piero Lingeri)

- 1936–37 Villa Bianco, Seveso (building and interiors)
 1936–37 Nuovo Campari Restaurant, Milan (building, interiors and furniture; with Piero Lingeri and Alberto Sartoris)
 1936–37 Asilo Sant'Elia Nursery School, Como (building, interiors and furniture)
 1938–39 Casa del Fascio, Lissone, Milan (building, interiors and furniture; with Antonio Carminati)
 1939–40 Casa Giuliani Frigerio, Como (building and interiors)

Terragni's furniture included cantilever designs in tubular steel and leather for the Casa del Popolo (1930) which were reissued after his death.

Tessin Family

Swedish architects, designers and collectors

The Tessin family, which consisted of Nicodemus Tessin the Elder (1615–81), his son Nicodemus the Younger (1654–1728), and his grandson Carl Gustaf (1695–1770), represents the foremost Swedish architectural dynasty of the late 17th and early 18th centuries. Their work dominated Swedish architecture between 1650 and 1740 and was synonymous with the flowering of the Swedish Baroque style. They were collectively responsible for many of the most prestigious royal commissions of this period and together they transformed the nature of architectural practice and the position of the architect in Sweden. Internationally acclaimed, their work did much to raise the status of Swedish architecture and culture abroad.

The Tessin family's rise to fame coincided with the emergence of Sweden as a great power in Europe, when the unprecedented prosperity of the ruling class offered numerous opportunities for the patronage of the arts and when diplomatic ties with the French court were especially strong. During this period, the need arose for an architecture that would represent a visible expression of the country's new Imperial status and that would rival that of Europe's other great powers. As early as 1637 the French architect Simon De la Vallée was summoned to Sweden where he was engaged by the royal family and worked for several other members of the Swedish court. It is within the context of De la Vallée's work for the Chancellor Axel Oxenstierna that the name of Nicodemus Tessin the Elder is first mentioned. Born in Stralsund on the Baltic (formally annexed to Sweden from 1648), Tessin had moved to Sweden in 1636 and shortly afterwards he was apprenticed to De la Vallée as an engineer and assistant architect. However, De la Vallée's career in Sweden was cut short when he was killed in a duel in 1642. And it was his son Jean, together with Nicodemus Tessin the Elder, who was to effect the development of a new style of architecture in Sweden.

Tessin's study tour of Europe from 1651 to 1653 had an important influence upon his career. His first independent commission after his return home was for Governor Schering Rosenhane's palace on the Riddarholmen in Stockholm (c. 1654). This building was to alter the direction of architecture in Sweden both with regard to ground-plans and façades, and to architectural expression and interiors.

By the 1660s Tessin had become the undisputed leader of architecture in Sweden and was working on royal, domestic and public commissions. His foremost creation was Drottningholm Palace, begun in 1662 for the Dowager-Queen Hedvig Eleonora. Work on this building continued over several

decades and was completed under the direction of Nicodemus Tessin the Younger during the 1680s. Tessin the Elder's talents as an interior designer were concentrated on the Queen's State Bedchamber (1668–83) which was situated in the heart of the palace. The state bed is placed in an alcove and is separated from the rest of the room by a broken screen and balustrade. Much of the decoration was derived from antique sources, and included a wall divided by Ionic pilasters, richly formed door surrounds and architraves embellished with relief medallions, and a magnificent ceiling featuring sunken reliefs and paintings. The carvings are gilded and were set off by a background that was originally black (the colour of mourning) in deference to the room's function as a memorial to the late king, Karl X Gustav. A rich intarsia floor consists of various woods laid in a pattern that mirrors the divisions of the ceiling. No other 17th-century Swedish interior approaches the all-encompassing splendour and opulence of this room. The dignity of its classical architecture meant that even in the 18th century it was used for every ceremonial occasion such as, for example, the nuptials of Adolf Fredrik and Lovisa Ulrika, the heirs to the throne in 1744.

Tessin's models for Drottningholm were drawn from both contemporary French and Dutch architecture, while the ground-plan was modelled on Italian prototypes. A monumental staircase, vestibule and satellite rooms occupy the central portion of the palace. Here the walls are also divided by pilasters and wall-niches. Italian stuccatores were summoned to execute the richly ornamented stucco ceilings, which featured exuberant Baroque volute-cartouches and profiled mouldings framing the central panels, and the walls were ornamented with reliefs of trophies and other stucco decoration. The richest decoration appeared on the staircase itself. In the less important rooms the costly stucco was replaced by painted imitations.

A common thread running through Tessin's architecture was the desire for order and symmetry both in the plan and the façades, and in the interior walls and details. His interiors contain relatively powerful modelling with classicising mouldings and frames surrounding fireplaces, doors and overmantels, and the articulation of the walls follows a common theme. The closest prototypes appear in 16th-century Italian volumes of prints, in particular those by Vignola and Palladio, but French publications, such as the engravings by Jean Le Pautre, were also influential. And another important inspiration for the elder Tessin's work was Pierre Le Muet's *L'Art de bien bâtir*; he had his own copy of this book which is preserved in the Royal Library in Stockholm.

Tessin the Elder's prolific career stretched over four decades and has come closest to being identified as the architecture of Sweden's "Age of Greatness". He oversaw the gradual change from a North German / Netherlandish Renaissance style of architecture with brick façades and carved sandstone ornament, to a severe version of the Roman Baroque. This latter style became intimately associated with the work of his son, Nicodemus Tessin the Younger.

Tessin the Younger was brought up by his father to follow in his footsteps and he completed his architectural training with a seven-year (1673–80) grand tour of Europe which was sponsored by Queen Hedvig Eleonora. During this time he spent long periods in Paris and Rome. While in Rome he

studied under Carlo Fontana, a student of Gian Lorenzo Bernini, the leading exponent of Baroque art and architecture. However, it was in France, where he was received by Louis XIV at Versailles and made contact with many of the leading French architects and designers of the period, that he gained a knowledge of recent developments in interior design. The year after his return home his father died and he was entrusted with the completion of his unfinished commissions.

Tessin the Younger's significance for Swedish art was if anything even greater than his father's. He can be described as a Swedish equivalent of France's Charles Le Brun, and his activities ranged from architecture and different areas of applied arts, to painting and sculpture. He made a great contribution as a designer of patterns for silver, and he also designed interior details for churches, such as the royal pews in Storkyrkan (The Great Church) in Stockholm.

Another foreign tour – again to Paris and Rome – undertaken at the end of the 1680s brought him into contact with the newest styles and most fashionable figures in the international art world. These new influences were brought to bear upon the completion of the interiors at Drottningholm where the Elder Tessin's more restrained architectural subdivisions in the staircase and the satellite rooms of the upper floor were replaced with a programme of paintings with allegorical subjects commissioned from painters such as Sylvius and Ehrenstrahl. Among other changes, this entailed walling up the ceiling lunettes so as to provide a setting for painting.

Tessin's largest and most important commission, however, was the Royal Palace in Stockholm. The new north wing took form during the 1690s, while the remaining sections were designed after a fire in 1697 that had entirely destroyed the old palace Tre kronor (Three Crowns). The palace's Italian façade frames an interior strongly influenced by French designs, with painted ceilings depicting allegorical subjects combined with stuccoed ceiling mouldings featuring frieze sculpture and reliefs – coloured white as marble or gilded like bronze. Tessin the Younger's ambition that the palace should be as modern a project as possible entailed summoning the first contingent of French artists to Sweden: the brothers René and Évrard Chauveau, the sculptor Bernard Fouquet and the painter Jacques de Meaux. Karl XI's gallery in the north wing displays the foremost results of this endeavour.

Tessin the Younger's most complete and best-preserved building is his own palace on the Slottsbacken (1696–1700) which was already begun before the present Royal Palace's conception. His creation of a symmetrical Baroque construction with a walled garden in this uneven confined space was a masterly feat. In addition, the interiors of the Tessin Palace are elegantly planned, with a differentiation of the function of each room. The whole was executed as a French palace with an Italianate façade as an external framework. An arched, centrally placed doorway, which extends through onto the garden, leads to a staircase which rises up to the main living quarters containing Tessin's and his wife's apartments. These extend out from the main building to narrow wings which surround the garden courtyard. In the upper guest and entertaining apartments the original rich interiors have been preserved as the most important examples of Tessin the Younger's artistic ambitions. Allegorical ceiling paintings, and wall paintings with landscapes between columns in the salon,

were executed by French artists who were also active at the Royal Palace in the Stockholm.

Steninge Castle (1694–98) for Carl Gyllenstierna can also be regarded as another of Tessin's most important Swedish commissions and included the general plan, the garden and the main building. However, Tessin's greatest projects, his new town-plan for Stockholm, the rebuilding of the Louvre in Paris, and an Apollo Temple at Versailles, were never executed.

The third generation of the Tessin dynasty was represented by Carl Gustaf Tessin. The son of Nicodemus the Younger, Carl Gustaf was one of the chief propagandists of a style of architecture that was guided by the highest artistic ambitions, and he sought to bring his father's programme for the Royal Palace to a point at which his work could compete with other court architecture on an international stage. To this end he summoned a second contingent of French artists, such as Guillaume Taraval, Charles Guillaume Cousin and Jacques Philippe Bouchardon, ornamental sculptors and other decorators to the Swedish court in the 1730s. He also pressed for Taraval's drawing school at the Royal Palace to have its status upgraded to the Royal Drawing Academy in 1735.

Carl Gustaf trained as an architect under his father's guidance. Extensive study trips abroad during his youth, and access to a rich library with collections of drawings and engravings, also provided him with the best foundations by which to master every aspect of architectural expression ranging from gardens to festival arrangements.

After Nicodemus the Younger's death in 1728, Carl Gustaf took over the completion of the Royal palace and he continued in the role of superintendent until 1741. In practice, the executive architect of this project was his collaborator, Carl Hårleman, while Carl Gustaf became increasingly involved in political and administrative activities and he served as a leading courtier until his break with Queen Lovisa Ulrika in 1752.

From 1739 to 1742 Tessin served as the Swedish ambassador to France; he was appointed President of the Chancellery from 1747–52, and Councillor from 1741–61. In 1756 he withdrew from public life and retired to his manor-house, Åkerö, in Södermanland, which was designed by Carl Hårleman. The interiors of this building illustrate Tessin's high artistic ambitions. The ground-floor of the two-storey main building, which housed Tessin's great art collection, was decorated by the painter Olof Fridsberg. The large salon or dining room has walls divided up by painted Ionic columns with landscapes in a classical style after designs for wall decorations by J.-J. Le Lorrain brought by Tessin back from France. Countess Tessin's cabinet, by contrast, was furnished in a much more thoroughgoing Rococo style and a watercolour view of the room painted by Fridsberg represents one of the most complete illustrations of Swedish Rococo period decor. It shows a still-extant corner-cupboard whose painted decoration by Fridsberg was designed by Tessin following French graphic models by François Boucher and Charles-Antoine Coypel.

The significance of the Tessin family lay not only in the work they themselves produced, but also in the grandeur of their conceptions and in the internationalism of their approach to architecture and design. The work of Nicodemus the Elder and Nicodemus the Younger, in particular, effected a decisive break with indigenous Swedish Renaissance styles and estab-

lished a new form of Swedish Baroque that drew heavily upon the classical tradition and Continental models and that brought the architecture of the Swedish court into line with that of other European great powers.

URSULA SJÖBERG
translated by Antonia Boström

Tessin, Nicodemus, the Elder 1615–1681

Born in Stralsund, 7 December 1615, of German extraction. Trained as a fortifications engineer; apprenticed to the Royal Architect Simon De la Vallée. Appointed Royal Architect to Queen Christina, 1646; undertook a study trip to Italy, France and Holland, 1651; returned to Sweden, 1653; appointed Stockholm Town Architect, 1661. Collector of prints, drawings and architectural books. Died in Stockholm, 24 May 1681.

Selected Works

Interiors

- 1654 Schering Rosenhane Palace, Stockholm (building and interiors): Baron Schering Rosenhane
- c.1662 Drottningholm, near Stockholm (palace and design for garden): Queen Hedvig Eleonora
- 1669–81 Strömsholms Palace, Västmanland (building and interiors): Queen Hedvig Eleonora
- 1670 Mälsåker Palace, Södermanland (building and interiors): Baron Gustaf Soop

Tessin, Nicodemus, the Younger 1654–1728

Born in Nyköping, 23 May 1654. Studied under his father Nicodemus Tessin the Elder, and learned architectural drawing at the German school in Stockholm; studied languages and mathematics at Uppsala University, 1670–72. Went on his first study trip to Italy, via Germany, and was apprenticed to Bernini and Carlo Fontana, 1673–78. Travelled to England, where he met Christopher Wren, and then to France, studying interior and garden design, 1678–80; second visit to Denmark, the Netherlands, France and Italy, 1687–88. Throughout his career he was in royal service: became court architect on the death of his father, 1681. Married 1) Countess Hedvig Eleonora Stenbock (died 1714); 2) Maria Barbro Horn af Marienborg. Via Daniel Cronström (1655–1719), the Swedish ambassador in Paris, he collected an enormous number of decorative and architectural prints and drawings. Designed a number of churches in Stockholm, and continued his father's involvement in the re-designing and building of the new Royal Palace, Stockholm, 1697–1728. Appointed Marshal of the Court, 1701; ennobled, and named Chancellor of Lund University, 1714. Also acted as a royal counsellor. Died in Stockholm, 10 April 1728.

Selected Works

Tessin's own drawings, and the huge number of prints that he amassed, are now divided between the Nationalmuseum and Royal Library in Stockholm: these are particularly rich in designs for Versailles.

Interiors

- 1689 Drottningholm Palace, near Stockholm (vestibule, staircase and park): Dowager Queen Hedvig Eleonora
- 1690s Tessin Palace, Stockholm (building and interiors)
- 1693 Amalienborg, Copenhagen (designs for unrealized palace): King Christian V of Denmark
- 1697–1728 Royal Palace, Stockholm (designs for new palace and interiors): Dowager Queen Hedvig Eleonora and Charles XII
- 1697–c.1704 Château de Roissy-en-France (building, interiors and gardens): Count d'Avraux
- 1712–14 Projects for the Louvre, Paris and for Apollo Temple, Versailles (unrealized): Louis XIV
- 1719 Designs for throne: Augustus II of Poland

Publications

Catalogue des Livres, Estampes et Dessins du Cabinet des Beaux Arts et des Sciences Appartenant au Baron Tessin, 1712 (now in Kungliga Biblioteket, Stockholm)

Tessin, Carl Gustaf 1695–1770

Born in Stockholm, 5 September 1695, the son of Nicodemus Tessin the Younger, who trained him in architecture; took drawing lessons from Hans Georg Müller. Sent with royal support on a 5-year study trip, visiting France (where he met Watteau, and received drawing lessons from Jean Bérain), Italy, Germany and Austria, 1714–19. There he began to amass an important collection of prints and architectural drawings. Appointed High Commissioner of public buildings, collaborating with Carl Hårleman, 1728. Married Countess Ulrika Lovisa Sparre af Sundby, 1728. Appointed Superintendent of the Castle Works, 1728, and head of the Office of Manufacture, 1729. Active as a diplomat and politician, and as an art historian. Died in Åkerö, Södermanland, 7 January 1770.

Selected Works

Tessin's important collection of drawings is held at the Nationalmuseum, Stockholm.

Interiors

- 1720s–53 Royal Palace, Stockholm (completion): Charles XII
- 1740s Åkerö Manor, Södermanland (together with C. Hårleman): Carl Gustaf Tessin

Thonet, Michael 1796–1871

German designer, entrepreneur and furniture manufacturer

Through his experiments with the bentwood process, Michael Thonet pioneered the mass production of furniture, and his chairs have become design classics. Born in Boppard-am-Rhein in Prussia, he trained as a cabinet-maker and set up in business there in 1819, specialising in parquetry. In 1830 he began experimenting with bent laminated strips of wood for making chairs – initially glueing four or five veneers together, then taking rods of beechwood and boiling or steaming them in glue and water to make into lightweight, curvilinear furniture. The process was also being investigated in New York City by German-born John Henry Belter, although his designs lacked the flexibility and flair of Thonet's.

In 1841 Thonet took out patents on his process of bending wood laminates in England, France and Belgium. His work attracted the attention of Prince Metternich and he was invited to Vienna, where in 1842 he set up business with furniture-maker Karl Leistler, supplying furniture to Prince Liechtenstein. In 1849 he worked for five years on the neo-Rococo interior decoration of the Liechtenstein Palace with English architect, P.H. Devignes.

Exhibiting his furniture at the 1851 Great Exhibition at Crystal Palace, Thonet was awarded the bronze medal for innovation, originality and elegance of form, setting a new precedent in industrial aesthetics which was taken up in the 1920s by the architects of Modernism. With the material and structural continuity of his early steam-bent laminated chairs, Thonet anticipated the modern chair. As the architect Frank Gehry declared, Thonet's achievements meant "the elimination of the extraneous, the unification of the essential, the celebration of the natural, the quest for the comfortable, and the popularisation of the beautiful". In 1853 Thonet was joined in the company by his five sons, forming Gebrüder Thonet and installing the first steam machines at the Mollard Mill in Vienna. By 1856 the company was employing some 70 people.

Thonet's *Side Chair*, Model No.14 of 1857, made out of bent solid beechwood, moulded laminated wood, and solid beechwood with wooden seat, embodies the principles associated with the Modern Movement in its minimal use of materials, lightness, versatility of form and suitability for mass production, a new phenomenon which began to permeate commercial and domestic interiors. Products of the Gebrüder Thonet company included coat hangers, kneelers, cafe chairs, hat stands, rocking chairs, music stands, baby cribs, sleds and tennis racquets.

The first company factory was opened in Koryčany, Moravia, in 1857, with a first-year output of 10,000 items of furniture. Here the *Consumer Chair*, Model No.14, consisting

Thonet designs from catalogue, 1873

of just six individual pieces of bentwood, was developed and manufactured. A second factory opened in Bystřice pod Hostýnem, also in Moravia, in 1862, followed by Halenkov and Vsetín, due to the abundance of quality wood in the region. Between 1859 and 1914, an incredible 40 million Model No. 14 chairs were produced, with Thonet employing 25,000 workers in some 60 factories throughout Europe. Since it first appeared, 50 million chairs of this classic design have been produced. At the 1867 World's Fair in Paris, with 60,000 visitors, Gebrüder Thonet won a gold medal for the *Demonstration Chair*. Developed by Michael's son August Thonet, it was made from two long, twisted bentwood rods – the ultimate *pretzel*.

At the time of Michael Thonet's death, the company was producing 400,000 items annually. By 1871, it had showrooms as far afield as Barcelona, Brussels, Bucharest, Chicago, Madrid, Milan, Moscow, Munich, New York, Naples, Odessa, Prague, Rome and St. Petersburg. After Thonet's death, his sons carried on the business and opened more factories, towards the end of the century manufacturing some 4000 items of furniture per day. In 1880, the company's administrative headquarters, Thonet House, opened in Vienna's prominent Stephansplatz. Following World War I, a major factory was established at Brno in Czechoslovakia.

In addition to their classic designs, Gebrüder Thonet also manufactured bentwood furniture for other avant-garde

designers, among them the architects Adolf Loos, Josef Hoffmann, Josef Frank and Marcel Kammerer. Marcel Breuer, Mies van der Rohe, and André Lucat also had their designs made by the company. In his early furniture, Le Corbusier was influenced by Michael Thonet's designs and frequently used the *Wiener Stuhl* (Viennese Chair) in his interiors, including the Pavillon de l'Esprit Nouveau at the Paris Exhibition of 1925. In the mid-1920s the Bauhaus began experiments with tubular steel furniture, manufactured again by the Thonet company.

Many of the ideas developed and manufactured by the company started by Michael Thonet in the early 19th century are alive to this day, fresh and fashionable

Biography

Born in Boppard-am-Rhein, Prussia, 1796, the son of a tanner. Apprenticed to a local cabinet-maker. Married Anne Crass, 1819; five sons all later involved in the running of Gebrüder Thonet. Opened a small cabinet-making shop c. 1820; experimented with bent-veneer chairs from 1830; first successful chair, 1836; first patents taken out, 1841. Moved to Vienna, 1842; worked as a cabinet-maker for Karl Leistler, 1843–49. Established Gebrüder Thonet and opened factory and shop, Vienna, 1853; granted non-renewable Imperial patent for the manufacture of bentwood furniture, 1856; new factories in Moravia, 1857 and 1862; other factories followed during the 1860s and 1870s and furniture was exported throughout Europe and the United States. Company exhibited at numerous international exhibitions; awarded a gold medal, Exposition Universelle, Paris, 1867. Died in Vienna, 3 March 1871; the company passed to his sons; merged with Kohn-Mundus after 1918; introduction of tubular steel furniture, 1929. It continues today as the Thonet Company, York, Pennsylvania, and Gebrüder Thonet AG, Frankenberg, Germany.

Selected Collections

Large collections of company catalogues and business records are in the Thonet Company Archives, York, Pennsylvania, and the Archives of Gebrüder Thonet AG, Frankenberg. Specialist collections relating to the manufacture and design of Thonet furniture are in the Austrian Museum of Applied Art, and the Technical Museum of Science and Industry, both in Vienna. Additional holdings of Thonet furniture are in the Museum of Modern Art, New York, and the Shelby Williams Industries Chair Museum, Morristown, Tennessee, which houses the Steinfeld collection of bentwood chairs.

Thornhill, James 1675/6–1734

English artist and decorative painter

A master of the flamboyant and heroic Grand Style, Sir James Thornhill was one of the foremost artists of the 17th century, and he did much to establish the Continental tradition of large-scale decorative painting in Britain. His career coincided with the final phase of the English Baroque style. An adroit manipulator of political factions and intrigue, he was patronised by royalty and members of the court, acquired various titles and rose to high office. His output was prodigious and his commissions included vast decorative schemes in many of the royal palaces and great houses, including Hampton Court, Blenheim and Chatsworth. Yet, ironically, he was the only decorative artist of renown working in this period who was actually British.

Following the austerity of life during the interregnum – the period of Oliver Cromwell's leadership – the latter half of the 17th century exulted in a revival of the arts in Britain. The enthusiasm for flamboyant display and ostentation is reflected in the technical excellence of those decorative artists whose work was both highly esteemed and highly paid. These artists helped to raise the status of decorative painting in Britain, which previously had been very low, although because of the generalised and fluid nature of artistic practices during the period, all art forms flourished, and notions of status were not necessarily central. It was not until the second half of the following century that artistic hierarchies were firmly established and the various forms of artistic practice were categorised separately.

The artistic world of 17th-century England centred on the court, and this, in turn, was dominated by a succession of artists from the Continent. This tradition, established by Sir Anthony Van Dyck, was continued by artists such as Sir Peter Lely and later Sir Godfrey Kneller. While these artists were concerned essentially with painting portraits, other Continental artists gained commissions in the field of decorative painting – namely Antonio Verrio and Louis Laguerre. A rival to Laguerre, Thornhill came to prominence after the death of Verrio.

Thornhill's training followed a traditional apprenticeship.

He was apprenticed in 1689 to Thomas Highmore of the Painter-Stainers' Company. Through Highmore's connections, he progressed to working under Verrio on the decoration of Hampton Court in 1702–04. Having purchased his freedom from the Painter-Stainers' Company in 1703 or 1704, Thornhill received significant commissions, including the decoration of the Sabine Room at Chatsworth and the dome over the nearby stone staircase.

In 1707 Thornhill received the commission to decorate the Great Hall at Greenwich Hospital (1708–27). The principal decoration, set in an oval on the ceiling, is that of William III and Mary bringing peace and freedom to Europe, surrounded by various mythical and allegorical figures. The hall is created in a grand Baroque style, and the remainder of the decoration is an elaborate allegory based on the Protestant Succession, including depictions of *The Landing of William III*, *The Landing of George I* and a group portrait of George I and his family.

It is recorded that Thornhill had dilemmas concerning the portrayal of the king and queen. He listed his "Objections that will arise from the plain representation of the King's landing as it was in fact ...". However, the resulting Baroque fantasy does not appear to rest uneasily compositionally, and depicting the king as he "should have been and not was" demonstrates that Thornhill was, if anything, a flatterer.

Thornhill was quick to grasp the need to work in a Continental style to satisfy the court, yet he promoted himself as an Englishman to gain favours from the British aristocracy. It was through this contact with influential figures that he received the commission to decorate the Prince and Princess of Wales' bedchamber at Hampton Court c.1714. The decoration of the room incorporates both allegorical references and portraits of the monarchy, thus stressing directly, and by subtle allusion, the power of the Royal House.

One of the most prestigious commissions that Thornhill received was the decoration of the dome of St. Paul's Cathedral. His success in gaining the commission rested perhaps more on political manoeuvres than ability, as his rivals for the job were painters of considerable note. But as he was the only Englishman in the running it was felt that the task should go to him.

Eight scenes depicting the life of St. Paul decorate the cupola. Painted in grisaille, these scenes are set in elaborately painted *trompe-l'oeil* architecture which owes a debt to Continental decorative schemes. The dome was begun in 1716 and completed in 1719 and, as one young viewer said to Thornhill at the time, "... we should now be able to vie with Paris for history painting which we have been so deficient in before".

Thornhill sought to improve the status of decorative history painting, and thus his own reputation, by acquiring various titles, such as president of the first academy of painting in 1715, following in the footsteps of Kneller, and in 1718 he was appointed History Painter in Ordinary to the King. In March 1720 he became Sergeant Painter to the King and in May of the same year he was knighted – the first English-born painter to receive this honour.

This period marks the busiest in Thornhill's career, and includes the interior of the Great Hall at Blenheim Palace

Thornhill: design for state bedchamber

(1716), which celebrates in grand, heroic style the victory of the Duke of Marlborough at Blenheim.

In 1718 Thornhill was decorating the staircase and ceiling of Charborough House with mythological scenes centred around the Judgment of Paris, and demonstrating his versatility at Eastbury Park (after 1719) by depicting the Ascension in the Chapel while decorating the Dining Room with appropriate mythological figures such as Bacchus, Venus and Ceres.

Thornhill's flamboyant, elaborate, Grand Style was not, however, universally popular. A new generation of arbiters of taste, or aesthetes, was laying down artistic doctrines that did not include the ostentatious display that so characterised Thornhill's work. These leaders of style – Lord Burlington and his protégé, William Kent – sought to impose their own artistic taste by taking over the H.M. Board of Works, the official commissioning body of the government. For Thornhill this meant losing to Kent in 1723 the major commission to decorate Kensington Palace – a commission promised to him by the previous Board of Works.

Thornhill continued to work after this coup until his death in 1734 but, as Paulson has noted, this ousting of position was “essentially doctrinal”. As Thornhill was displaced, “the school of fashionable purists led by Lord Burlington captured the citadel of architecture, the Office of Works, and sealed the doom of the Baroque school of Wren”. It was the end of an era.

DORCAS TAYLOR

Biography

Born in Dorset, 25 July 1675 or 1676. Apprenticed to the painter Thomas Highmore (1660–1720), London, 1689; assisted Antonio Verrio 1702–04; purchased his freedom from the Painter-Stainers' Company, 1703 or 1704. Married to Judith Thornhill: daughter Jane married William Hogarth. First independent commissions from c.1704; principal works for interiors, including Chatsworth, Greenwich and St. Paul's, executed between 1708 and 1725. Visited

the Netherlands, 1711, and Paris, 1717. Director, Sir Geoffrey Kneller's Academy, London, 1711; Governor, 1716. Appointed Painter in Ordinary to the King, 1718; made Sergeant Painter and Master of the Painter-Stainers' Company, 1720; knighted, 1720. Painted scenery for Drury Lane opera *Arsinoë*, 1705, and for court theatricals, 1718; designed a rose window for Westminster Abbey before 1721; decorated the lid of a harpsichord for Handel; and executed some book illustrations. Elected Member of Parliament for Weymouth, 1722; Fellow of the Royal Society, 1723. Died at Thornhill Park, near Stalbridge, Dorset, 4 May 1734.

Selected Works

Collections of Thornhill's drawings for decorative commissions are in the British Museum and the Victoria and Albert Museum, London. Sections of Thornhill's work for the Guildhall are in the collection of the Corporation of London, Guildhall, London. Many of Thornhill's large-scale paintings also survive *in situ* in houses such as Blenheim, Chatsworth, and Moor Park.

Interiors

- c.1702–08 Chatsworth House, Derbyshire (ceiling of the West Entrance Hall; walls of the Little Dining Room; walls and ceiling of the Sabine Room; ceiling of the West Front Staircase; ceiling of the Yellow Silk Drawing Room): 1st Duke of Devonshire
- 1702–13 Easton Neston, Northamptonshire (monochrome decoration on the ceiling and walls of the Hall, and the Staircase walls): Thomas Fermor, 1st Earl of Pomfret
- 1705 Stoke Edith, Herefordshire (walls and ceiling of the Hall and Staircase; overmantels in the Green Velvet Bedroom and Mr. Foley's Bedroom): Thomas Foley
- 1708–27 Greenwich Hospital, Kent (ceiling of the Lower Hall (1708/9–12); side walls of the proscenium; walls and ceiling of the Upper Hall (1718–25); walls and cupola of the Vestibule (1726–27))
- c.1710 Hanbury Hall, Worcestershire (ceiling of the Hall; ceiling of the Dining Room; walls and ceiling of the Staircase): Thomas Vernon
- c.1714 Hampton Court Palace, Hampton, Middlesex (Queen's Drawing Room, Chapel, Queen's Closet, Queen's Bedchamber, and Staircase)
- 1714–21 St. Paul's Cathedral, London (decoration of the cupola, lantern and Whispering Gallery of the dome)
- c.1715–20 Sherborne House, Dorset (walls and ceiling of the Staircase and Staircase Hall): Henry Seymour Portman
- 1716 Blenheim Palace, Oxfordshire (walls and ceiling of the hall, and the Saloon; large design for a tapestry): 1st Duke of Marlborough
- 1720–28 Moor Park, Hertfordshire (walls of the Hall and Gallery; also stuccowork): Benjamin Styles
- 1725–27 Guildhall, London (overmantel, overdoors and ceiling for the Court of Aldermen)
- 1731 Thornhill Park, near Stalbridge, Dorset (ceiling of the drawing room and gallery): Sir James Thornhill
- c.1731–32 Queen's House, Greenwich (Queen's Bedchamber)

Three-Piece Suites

It seems likely that the three-piece suite, a seating feature in the living-room or lounge of most British homes, originated as a contraction of the seven- or nine-piece sets of upholstered drawing room seating that were popular in the homes of the comfortably-off Victorian middle-classes of the 19th century. Reduced to the armchairs and the settee, the three-piece ensured the enjoyment of similar comfort, and family-centred life and values, in the smaller parlours of less affluent homes too. Established as a centrepiece of the home, the three-piece suite has been sustained with undiminished continuity and few fundamental changes since. Upholstered suites may still include matching items such as footstools and chaise-longues, but the three-piece set consisting of a two- or three-seater settee and two identical easy-chairs is still the unit favoured in the lower-priced sector of the market.

The rise in popularity of the three-piece suite is usually associated with the suburban semi-detached mass housing of the inter-war years, as an outcome of the “Suite-itis” which according to unsympathetic design commentators, afflicted the newly-settled homemakers. But the three-piece upholstered set, along with the bedroom suite and the dining suite, were the customary items for which most couples saved through long engagements, to begin married life with virtually complete homes; or else a hire-purchase agreement could be entered into. Suites had long been staple commodities of the furniture trade.

The suite, and hire-purchase, were never restricted to modest homes, as advertisements in interior design magazines, manufacturers’ brochures and the stock of shops serving the

wider social spectrum will reveal, but the suite has been stereotypically associated in design-advice literature with a lower-class lack of imagination or vulgar bad taste. But luxurious three-piece suites also appear in Gordon Russell’s work for wealthy clients.

The retail trade has traditionally been accused of refusing to expose the mass-market to more progressive design and exploiting the suite’s eye-catching potential to increase sales. But its longevity is due more to the manufacturers’ combining cosy, homely, symbolism with the enrichment of stylistic significations.

Many styles associated with comfort, or in fashion, have been incorporated, ranging from the European historical, for example, Queen Anne and Knole styles, and varieties of Victorian and Edwardian padding and buttoning, to more exotic fringed and tasselled “Turkish” conceits of “saddle-bags and velvet”. This versatility is allied to a capacity for hybridisation which is the most striking characteristic of the three-piece suite, and, second to comfort, may be that which most endears it to popular taste and inevitably inspires execration from design purists and style cognoscenti.

Stylistically, perhaps the suite’s most interesting and bizarre period was the 1930s, when it ranged from the sober simplicity of wide-armed club styles in brown or green rexine, softened with matching velvet seat cushions, to Moderne styles sporting exuberant Art Deco-derived geometrical curves, in velvets and moquettes, jazz-patterned, or with Cubist-like abstractions of natural forms and lines. The ubiquitous sunburst motif featured on carved or pressed wood arm fascias, or inspired the shape of upholstered backs, with two colours divided by lines of piping. New types of leather-cloths, for example *Vynide* and *Dermide*, were suitable for such effects, and added washability to the emulation of leather’s luxury without its price.

In trade brochures of the time, new ways of advertising furniture appeared, showing a mixture of the glamorous with the homely which the suite styles of the time incorporated. A catalogue of Smarts & Co. of c.1935 shows film stars at home endorsing fashionable suites, and attractive young couples are pictured enjoying up-to-the-minute fireside comfort in massive armchairs and settees. Evocative copy emphasises the suite’s functions: A soothing, sympathetic lounge suite like this makes you feel like a giant refreshed after a hard day and a comfortable harbour when you feel tired, but it retained great dignity of appearance.

During and after World War II, suite furniture came under the critical scrutiny of government commissions, set up to improve the standards of British industry. Design reform institutions, such as the Council of Industrial Design, sought to educate mass taste to develop a demand for Modern, designer-led furniture, advocating unit or modular furnishing, and individually designed seating based on principles which differed from those of popular taste. After release from the imposition of Utility designs, not unexpectedly, mass demand and the trade returned for a while to pre-war traditions of the suite, and its hybrid and historicising forms continued unabated until the Scandinavian-influenced Modernism of the 1950s – the Contemporary, or Festival of Britain style – was assimilated into popular mass-produced furniture. Light, wooden arms and legs replaced the padded scrolls and floor-length bases.

Upholstered seating for the mass-market of the 1960s and 1970s incorporated innovations such as tension springs, Pirelli webbing and latex foam padding, and achieved the lighter, leggy effects derived from Modernist design. However, such new technology was also used for the substructure of traditional, bulky suites, and only the tapered profile and more steeply angled arms with wood knuckles quoted the Contemporary style. Fibre-glass or metal frames might also be the hidden supports of orthodox fringed and ruched Regency styles. However, the more avant-garde, organic form of the 1950s, by designers such as Arne Jacobsen, Eero Saarinen and Charles Eames, penetrated the popular market and were in vogue by the 1960s and 1970s, but popular desire for the three-piece suite format survived, producing some curious conversions of single chair forms to settees – the pedestal or swivel leg presented a problem for assimilation.

New plastic-coated PVC and vinyl covers such as *Airskin* and *Gantskin* were favoured, especially in shiny black, for the low-backed buttoned and quilted suites which featured in many homes of the 1970s. They established a middle ground between Modern and traditional forms, and some incorporated features of contract furniture design.

A fashionable revival of 19th-century styles, including American traditional styles, still survives from the heritage-conscious 1980s, coexisting with some Continental forms, and has broadened the appeal and quality of the suite again.

The furniture trade categorises the plethora of styles as “Traditional”, “Classic” or “Modern / Contemporary Traditional” and encompasses Victorian, Chesterfield, high-backed, and hybridised heavily-upholstered types, as well as “Cottage” suites. This category is associated with a variety of textile covers – velvets, Jacquards, brocades, floral chintzes and orientally-inspired prints. The “Modern” styles, aimed at the younger consumer, are characterised by lower backs and fewer but longer back-cushions; they are generally plainer, unless they are of the quilted duvet or pinch-pleated styles. The Classic types may share aspects of both foregoing categories. Usually fairly plain and with low backs, they feature the padded, scrolled arms or the squarer form of club styles. The covers may range from the ubiquitous acrylic velvet, *Dralon* to the modern flatweave, to damask or brocade, retaining the piped articulation of some of the Traditional styles. Changes in colour and textile offer fashionability, and suites are named to give added connotations of luxury and glamour, comfort and dependability, or the allure of stylish foreign resorts.

The three-piece suite remains a phenomenon of the average British home, symbolic of the family in its form and matching components, and offering hospitable accommodation for visitors, to the extent of the discreet incorporation of a bed in the settee. The bed-settee – most famously the *Put-U-Up* introduced by Greaves and Thomas in the 1920s – is the only invader which has been successful. This is due to the total disguise of its secondary function as sleeping accommodation by which it avoids disrupting the conventions of sitting-room furnishing.

A threat to the dominant three-piece format arose in the 1980s with popularisation of the set of two matching settees (with or without a chair) – perhaps due to the advent of central-heating in more homes, the settee need no longer be placed opposite and the chairs symmetrically at each side of the

fireplace, the customary focus. The occasional table (by the mid-1930s), or the coffee table (by the 1950s), and the standard lamp had become usual accessories to this arrangement.

The three-piece suite is possibly part of a vernacular culture, as it expresses the continuity and values of ordinary lifestyles and conservative tastes. Remaining one of the most familiar, widely acquired strategies of British furnishing, it evolved independently of high-culture aesthetic values, and lacking the kudos of named designers, it is without a place in legitimate design history.

Tiepolo, Giambattista 1696–1770

Italian artist, engraver and decorative painter

G.B. Tiepolo was the most important decorative painter of 18th-century Venice, although his powers were by no means limited to the field of decorative work. From an early age his work was in great demand both at home and abroad and he was employed by several foreign patrons, including the Prince-Bishop of Würzburg. During the 17th century Venice’s economy had declined, until by the time of Tiepolo’s first years as a painter the city was largely serving Europe solely as a source of luxuries. Although there were new commissions within the wealthy families or the religious orders of Venice, it was from abroad that the bulk of painting commissions came, and, like many Venetian artists, Tiepolo travelled far. His last

Tiepolo: staircase ceiling, Residenz, Würzburg, 1751-52

decade was spent working in Spain for the crown, where his decorative style continued in fashion after the advent of a more Neo-Classical taste in Italy.

Tiepolo was a pupil of Piazzetta, from whom he learned economy and a respect for form: unlike Tiepolo, Piazzetta built up his compositions with near-monochrome colouring and, although Tiepolo was to develop a love of exotic colours and patterned fabrics, he never lost the lessons imbibed from his master of the importance of draughtsmanship and overall control of design.

The artistic tradition of Venice had always been distinguished by its decorative qualities, a taste for sumptuous patterns and colours which reached its apogée in the 16th century in the work of Veronese. To this, Veronese added *sotto in su* architectural effects in his ceiling paintings. Throughout his training, any Venetian painter would have been very conscious of Veronese, more so than of the more sober Titian, little of whose work had remained in Venice. Tiepolo was an artist in whom contemporaries felt that they saw recreated the glories of Veronese; but in retrospect this is a judgement that

does not do credit to Tiepolo, since his work is of more sophisticated and complex a nature than Veronese's.

The majority of Tiepolo's decorative schemes are in fresco, although he was equally able to work in oil. Fresco was not the natural medium for Venetian painters, since the salt air and damp had always made it a poor medium in which to work: traditionally large painting cycles, such as in the Doge's palace or at the Scuola di San Rocco, consisted of huge canvases set into gilded wooden compartments. However, fresco was practised on the mainland in Venetian country homes, the most famous of which is Veronese's Villa Barbaro, so that it would not have been difficult for Tiepolo to have learned fresco. He seems to have had a natural affinity for the paler colour imposed by the medium, since his palette lightened after his first major fresco commission at Udine, a lightness which he retained in most of his oils thereafter. Most striking in Tiepolo's use of fresco is the surety of his execution and his draughtsman's skills. Fresco allows for no *pentimenti*, yet Tiepolo was confident enough of his drawing to execute drastically foreshortened figures. The same skill in draughtsman-

ship allowed him to fit human figures into the sometimes awkward shapes imposed by an interior, without their suffering from the restriction. A number of drawings survive which appear to be experiments with foreshortened figures with no known scheme in mind, suggesting that he enjoyed the challenge. He also worked fast, and was able within the *giornata* of wet plaster not only to paint figures, but also to dress them in elaborately patterned fabrics and jewels.

His greatest originality lies in the methods by which he achieved his illusions of height in ceilings. In the tradition of Veronese and the later Roman Baroque illusionists, such as Pietro da Cortona or Padre Pozzo, a number of his ceilings contain fictive architecture which rises up into the skies above our heads. For these effects, he worked usually in collaboration with Mengozzi-Colonna, his *quadratura* specialist: their most outstanding joint creation is in the Palazzo Labia where balconies for musicians and distant balustrades are glimpsed in the corners of the room. In others of his compositions, vertiginous figures look down at the spectator from the edges of these ceilings, emphasising their height above ground level, as in the soldiers lounging on the steps in the ceiling of Gesuati.

Yet the Gesuati is unusual in its reliance on architecture for its effects; as his career advanced, Tiepolo became more confident and dispensed with architectural aids to the illusion of height. Instead he relied on foreshortened figures, presenting them as steeply as possible while still maintaining legibility, to create a more virtuosic illusion of infinite skies. With the Rococo artist's freedom from a tightly-filled, symmetrical composition, Tiepolo developed a distinctive design of sky which is largely empty, save for a few birds, angels or putti; this design is the more realistic for this economy, and could be called an *Amor Vacui*. Although the groups in Tiepolo's ceilings are sparsely placed and few, he makes them visually enthralling by clustering figures together with clouds and drapery so that the whole forms a knot with an unexpected and complex outline. These clotted groups never, however, obscure the most important elements of any narrative, such as the scapular given to S. Simeon (Carmine), or the rosary given to S. Dominic (Gesuati): these are isolated and remain legible even from their great height.

When, more rarely, commissioned to do a whole room, Tiepolo, with great originality, conceived of the entire room as one surface, out of which he created a new, illusionistic world. Palazzo Labia is the summation of these effects: the realities of the room, the windows and doorways, are absorbed into the illusory structures, so that the spectator has difficulty in separating reality from fiction.

Perhaps one of the most important skills for a decorative painter is the ability to respond to his site. This is not simply a matter of matching colour and painted light to the existing location, although the Kaisersaal at Würzburg shows Tiepolo well able to equal the rich marbles and gilded stucco with a sumptuousness of paint all the more astonishing given the naturally paler colour effects of fresco. It is more a matter of designing in a scale and ambitiousness appropriate to the space. The degree to which Tiepolo does this may be gauged by comparing his *modelli*, where they survive, with the finished frescoes. Frequently the *modelli* reveal his instinct for what would work in large scale, where tightly clustered groups of figures are replaced in the finished fresco with a more open

design, and the architecture is diminished, sometimes even to be replaced with open sky or landscape. The *modello* for the ceiling of the Scalzi in Venice, showing the miraculous transportation of the Holy House of Loreto, has the Virgin perched on the roof of the Holy House, with a very indistinct lightly coloured figure of God behind and above: in the finished fresco (now destroyed), the group around God was strengthened, darkened and enlarged, the better to fit the waisted space of the nave.

The best example of all of these skills brought together is at Würzburg, in the Treppenhaus. Here Tiepolo is at his finest as creator of skies with minimal architecture, of daringly foreshortened figures, of rich bright patterns and intricate details, and of one final element not yet mentioned, his humour. Figures peer over the edge, enjoying the joke of the illusion they represent, or are given very ordinary attributes or actions, despite their elevated mythological status, with a delight in the light-hearted that was a characteristic of Tiepolo's art throughout his life.

CHANTAL BROTHERTON-RATCLIFFE

Biography

Giovanni Battista Tiepolo. Born in Venice, 5 March 1696. Probably studied under Gregorio Lazzarini. First known work was for the Ospedaletto, Venice, 1715–16; elected to the Venetian painters' guild, 1717. Married Cecilia, sister of the painters Francesco and Giovanni Guardi, in 1718; two sons: Gian Domenico (1727–1804) and Lorenzo (1736–76). Collaborated with Girolamo Mengozzi-Colonna on church decoration, 1724–62. Summoned to Udine by the Patriarch of Aquileia, Dionisio Dolfin, to decorate the patriarchal palace, 1725; in Milan working for Casati family, 1731; in Venice, Bergamo and Vicenza, 1732–36; refused commission for Stockholm Royal Palace, 1736; worked on church decoration in Venice, 1737–39; returned to Milan, 1740. In Venice collaborating with Mengozzi-Colonna, and employed by Labia family, 1750. With his sons, worked in Würzburg at request of Prince-Bishop Carl Philipp von Greiffenclau, 1751–53; worked in Venice, Padua and Udine, 1754–62. First President of Venice Academy, 1755. Travelled to Madrid with his sons, 1762. Died in Madrid, 31 January 1770.

Selected Works

The Victoria and Albert Museum, London, has a large holding of Tiepolo's drawings.

- 1724–25 Palazzo Sandi, Venice (ceiling frescoes)
- 1726–29 Patriarchal Palace, Udine (staircase, gallery, Throne Room, Sala Rossa): Patriarch of Aquileia, Dionisio Dolfin
- 1731 Palazzo Dugnani-Casati, Milan, (frescoes in Salone): Count Giuseppe Casati
- 1734 Villa Loschi Zileri dal Verme, Biron, near Vicenza (Salone monumentale and Salone d'Onore)
- c.1736 Villa Corner, Merlengo (ceiling frescoes): Corner family
- 1739 Scuola della Carità, Venice (ceiling)
- 1740 Palazzo Clerici, Milan (vault of gallery): Marchese Giorgio Antonio Clerici
- 1743 Villa Cordellina, Montecchio Maggiore, near Vicenza (wall and ceiling frescoes): Carlo Cordellina
- 1745–48 Palazzo Labia, Venice (ballroom walls and ceiling, Sala degli Specchi): Labia family
- 1751–53 Kaisersaal and Residenz, Würzburg, Franconia (staircase and ceilings): Prince-Bishop Carl Philipp von Greiffenclau
- 1757 Villa Valmarana, Vicenza (atrium and four ground-floor rooms): Leonardo Valmarana
- 1758 Palazzo Barbarigo, now Ca' Rezzonico, Venice (ceiling)
- c.1760s Villa Marchesina, Vicenza (frescoes): Giorgio Marchesina

- 1761 Villa Pisani, Strà, near Padua (ballroom ceiling): Pisani family
 1762–66 Royal Palace, Madrid (throne room, guard room, and Queen's antechamber): Charles III

Tiffany, Louis Comfort 1848–1933

American designer and painter

The name of Louis Comfort Tiffany is now synonymous with high-quality decorative vases and glass lamps produced during the late 19th and early 20th centuries. Tiffany began his career, however, as a landscape painter. Indeed, he continued to draw and paint throughout his life and although, professionally, he subsequently concentrated on designs for ceramics, jewellery, and tableware, his major contribution to interiors was in the spheres of decoration and stained glass. A lover of the sumptuous and opulent, he lived in a style that has been compared to that of the Medici princes, and he promoted several projects aimed at increasing public support for the decorative arts, eventually converting his elegant country home into a centre for the study of the arts. Like his rival, John La Farge, Tiffany was cultivated, charming and socially-skilled. He moved easily

among artistic leaders and businessmen alike and was frequently called upon to provide decorative plans for churches, mansions and civic buildings. Moreover, he was wealthy and well-connected in his own right. He was born the son of the founder of Tiffany and Company and the family name was clearly sometimes instrumental in helping to secure commissions. For example, Tiffany's father was a founder-member of the Union League Club, New York, where his firm carried out some of their finest work and created decorations for the grand staircase, various windows and tapestries.

Tiffany's early training was in the fine arts and he formed a close friendship with the painter Samuel Colman. The two travelled together through Spain, North Africa and Egypt in 1870 and Tiffany's later glasswork was strongly influenced by the Hispano-Moresque and Roman glass that he saw on this trip. In 1879 he joined with Colman, Lockwood de Forest, and the needlework artist Candace Wheeler, in forming Louis C. Tiffany and Associated Artists, a firm of art-decorators that combined expertise in textiles, ceramics, glass and other decorative arts. With Tiffany as director the company devised overall decorative schemes for many wealthy and famous clients, including George Kemp and Cornelius Vanderbilt II in New York, and Mark Twain in Hartford, Connecticut. They also provided interiors for several important institutions, notably the library and veterans' room in New York's 7th Regiment Armory, and by 1882 Associated Artists was sufficiently highly thought of and well-known for President Chester Arthur to invite Tiffany to redecorate several major rooms in the White House.

Tiffany's interest in overall decorative schemes was probably influenced by the work of Aesthetic artists such as J.M. Whistler whose notorious Peacock Room was completed in 1877 and whose *Butterfly Suite*, designed with the architect E.W. Godwin, was exhibited at the Paris Exposition Universelle in 1878 and published widely. These interests were encouraged further though Tiffany's acquaintance with Oscar Wilde whose lectures on "House Decoration" he had attended during the course of Wilde's American tour in 1882–83.

Tiffany's first interiors featured a combination of oriental and Indian motifs and included ornate lamps, fireplace tiles, and windows containing the opalescent glass favoured by John La Farge for its texture and depth. But his interest in working almost exclusively in glass was growing: he took out patents for some of his own glass processes in 1880–81, and he split off from Associated Artists to form Louis C. Tiffany and Co. in 1883. The company was renamed the Tiffany Glass Company and incorporated with Tiffany as president in 1885; in 1892, it was reorganized as the Tiffany Glass and Decorating Company.

The stained-glass side of Tiffany's business became increasingly popular with architects and other professionals, even as the public bought his vases, lampshades and other tablepieces. After 1888, when the architect Stanford White split with La Farge, his stained-glass contracts were passed to Tiffany. Other major commissions also flowed into his office, the most lucrative being the decoration of the Ponce de León Hotel in St. Augustine, Florida, for the great Florida resort developer, Henry Flagler; five churches between 1889 and 1893; the new library for the Pratt Institute, Brooklyn, in 1896; and mansions for William K. Vanderbilt, Whitelaw Reid, and Mr. and Mrs.

Tiffany: living room, Laurelton Hall, Oyster Bay, Long Island, c.1902; photo c.1924 by David Aronow

Henry Havemeyer. Tiffany continued to paint and exhibit during this period, and he also began to study historical and contemporary glass more systematically. The organic style of the French designer Émile Gallé impressed him when Tiffany saw it at the Paris Exhibition of 1889, and his own designs became more abstract and evocative. At the same time, his deepening relationship with the influential critic, dealer and entrepreneur, Siegfried Bing, meant that his work also achieved a renown in Europe that was unprecedented in the history of American decorative arts. In 1895 he made series of ten stained glass windows for Bing that were designed by a group of distinguished modern French painters including Henri Toulouse-Lautrec, Pierre Bonnard, Edouard Vuillard, and Paul Sérusier, that were exhibited in Paris at the Société Nationale des Beaux-Arts. Even more celebrated was the group of three rooms designed for display in the manufacturers and Liberal Arts Building at the Columbian Exposition of 1893 and which became a main attraction of the fair. One room, the chapel, consisted of a white marble altar, with a white and iridescent glass mosaic front. This space was filled with organically flowing designs and the columns were covered with glass mosaics of abstract design, but the twelve stained glass windows were the stars of the million-piece glass ensemble. Tiffany also showed six of his paintings at the Exposition but

his chapel was so successful that it was purchased and later donated to the Cathedral of St. John the Divine in New York.

Business remained brisk for the Tiffany company through the turn of the century, but the impact of new forces that favoured a more restrained approach to architecture and decoration put him on the defensive. Nevertheless, there were still many large-scale commissions. These included the glass curtain for the National Theatre in Mexico City, that had 200 panels, each three feet square, and that weighed 27 tons, and the glass mosaic, 15 by 49 feet in dimension, of Maxfield Parrish's painting *The Dream Garden*, that was made for the Curtis Publishing company of Philadelphia, and finally, the window called *The Bathers*, based on one of his paintings that Tiffany made for his own magnificent home. Although these later works are often figurative, their overall design is far more abstract than the earlier orientalisising and Middle Eastern-inspired work: dream and inspiration had replaced the exotic and the mysterious. By the time that Tiffany died in 1933, there were approximately 900 glass studios operating in the United States and his name had lost some of the lustre of the early years. The Tiffany Glass and Decorating Company was simply viewed as one among a large number of commercially successful studios.

Many of the mansions and churches on which Tiffany

worked have been destroyed or remodelled, leaving only the smaller, more portable items produced by his firm to represent the Tiffany name in museums and private collections. Thus, although Tiffany's contribution to the development of stained-glass decoration was both substantial and extremely influential, it is items such as bottles, vases, lampshades and applied panels, decorated with flame and ostrich-plumed designs that are more accessible and better-known in the United States and Europe today.

Biography

Born in New York City, 18 February 1848, the son of Charles Louis Tiffany, owner of Tiffany and Company. Studied painting informally under George Inness, c.1867; enrolled at the National Academy of Design, New York, 1866–67; studied painting in Paris under Léon Bailly, 1868–69. Travelled through Spain, North Africa and Egypt with Samuel Colman 1870. Married 1) Mary Woodbridge Goddard, 1872 (died 1884): 3 children; 2) Louise Wakeman Knox, 1886 (died 1904): 3 children. Active as a painter in New York from the early 1870s; first experiments in glass manufacture, 1873; involved in interior decoration from 1879; first designs for mosaics and wallpaper, 1880. Formed interior decorating company, L.C. Tiffany and Associated Artists, New York, in partnership with Samuel Colman, Lockwood de Forest and Candace Wheeler, 1879; partnership dissolved, 1883; established Tiffany Glass Company, 1885; reformed as Tiffany Glass and Decorating Company, with glass manufacture in Corona, New York, 1892; firm's name changed to Tiffany Studios, 1900. Registered *Favrile* trademark for glass products including vases and lamps, 1894. Appointed Design Director of the family business Tiffany and Company, 1902. Created Louis Tiffany Foundation to assist young artists, 1918. Retired from Tiffany Studios, 1919; business divided into Tiffany Furnaces for the manufacture of *Favrile* glass, and Tiffany Studios, 1919; Tiffany Furnaces dissolved, 1924; Tiffany Studios declared bankrupt, 1932. Exhibited stained glass and glassware at numerous national and international exhibitions including World's Columbian Exposition, Chicago, 1893; Salon, Société Nationale des Beaux-Arts, Paris, 1895, including designs by Pierre Bonnard, Ker-Xavier Roussel, Edouard Vuillard, Maurice Denis, Henri de Toulouse-Lautrec, Felix Vallotton and Paul Sérusier; Siegfried Bing's L'Art Nouveau Gallery, Paris, 1895; Exposition Universelle, Paris, 1900; Turin Exposition, 1902. Received numerous medals and awards including the Légion d'Honneur, Paris, 1900. Died at Laurelton Hall, Long Island, 17 January 1933.

Selected Works

Large collections of Tiffany's glassware and examples of stained glass are held by the Corning Museum of Glass, Corning, New York, the Metropolitan Museum of Art, New York, and the Smithsonian Institution, Washington, DC. Cartoons and designs for the company's stained glass and examples of Tiffany's watercolours and paintings are in the Metropolitan Museum of Art. A long list of Tiffany windows, which updates the company's own lists of 1893, 1897 and 1910, appears in Duncan 1980.

- 1880 Veterans' Room and Library, 7th Regiment Armory, New York (decoration with Associated Artists)
- 1880–81 Union League Club, New York (entrance stairway and halls with Associated Artists)
- 1881 William S. Kimball Residence, Rochester, New York (decoration and furniture with Associated Artists)
- 1881 Mark Twain House, Hartford, Connecticut (decoration with Associated Artists)
- 1881–82 Cornelius Vanderbilt II Mansion, New York (decoration with Associated Artists)

- 1881–82 J. Taylor Johnson House, New York (parlour with Associated Artists)
- 1882–83 The White House, Washington, DC (decoration with Associated Artists): President Chester Arthur
- 1885 Tiffany Mansion, 72nd Street, New York (decoration; building by Stanford White)
- 1889 Chittenden Window, Yale University, New Haven
- 1890–92 Henry O. Havemeyer House, New York (redecoration)
- c. 1900 Preston Bradley Hall, Chicago Public Library (mosaic mural, decoration and glass dome)
- 1911 National Theatre, Mexico City (glass mosaic curtain)
- 1912 Joseph R. DeLamar residence, Madison Avenue, New York (*Peacock* and *Cockatoo* glass panels)
- 1914 Laurelton Hall, near Oyster Bay, Long Island (*The Bathers* stained glass window): L. C. Tiffany
- 1915 Curtis Publishing Company, Philadelphia (*The Dream Garden* mosaic mural by Maxfield Parrish)

Tiles: panel from the palace of Fuad Pasha, Turkey, 18th century

Tiles

The history of ceramic tiles in Europe goes back to Roman times when mainly plain terra-cotta tiles were used in Roman baths and as construction material for walls and roofs. The origins of decorative tiles in architectural interiors in Europe are to be found in the Middle Ages when a Northern European and Southern European tradition of tile production and application emerged.

In Northern Europe, cathedrals and abbey churches, and the palaces and houses of medieval kings, bishops, and merchants, were decorated with inlaid tiles. This is a type of ceramic tile in which a pattern or figurative motif is inlaid with a contrasting coloured clay into the main body of the tile. The inlaid floor tiles at Clarendon Palace near Salisbury, Westminster Palace in London, and those at the Château de Suscinio at Morbihan, near Vannes, Brittany, are examples of applications in secular buildings. A very fine ecclesiastical example of medieval inlaid tiles *in situ* can still be seen in the 13th-century Westminster Abbey Chapter House, London. A second type of tile produced at this time was the stamped relief tile which received its decoration when the clay was pushed into a mould with a relief or intaglio design at the bottom of the mould giving the tile either a raised or indented surface pattern. Although relief tiles were used in Britain, they were more commonly employed in Germany in churches and castles.

In Southern Europe a different tradition evolved. The Moorish builders of the 14th-century Alhambra Palace, Granada, Spain, used coloured ceramic mosaic tiles as wall coverings in combination with decorative plasterwork in rooms and courtyards. This Moorish trend in interior tile decoration was also practised in the Palace of Peter the Cruel in the Alcázar, Seville, where much of the original decoration can still be seen today.

Another type of tile that emerged in Spain was the tin-glazed tile. These tiles are covered with a lead glaze to which tin-oxide has been added which when fired becomes an opaque white. This provides a surface on which patterns and pictures could be painted, thus offering more decorative and figurative design possibilities for the tile-maker. A thriving centre of tin-glaze tile and pottery production grew up in Valencia during the 14th and 15th centuries. Tiles painted in blue on a white ground, with the addition of lustre if required, were made for use on floors and ceilings. Spanish tile-makers sometimes moved to France to carry out special commissions such as for the Papal Palace at Avignon in 1362 and for the Duc de Berry in Poitiers between 1384 and 1386.

Italy's proximity to the Middle East meant that the tin-glaze technique had also found its way there during the Middle Ages. By the Renaissance the manufacture of such tiles had developed into a flourishing industry and the addition of colours such as green, yellow, and orange, as well as the more conventional blue, resulted in the stunning maiolica technique. These tiles were painted with a great variety of different patterns, including portraits and heraldic devices, and were used on the floors of churches and the palaces of princes and popes. The tiles made for pope Nicholas V in the Castel Sant'Angelo, Rome, and the magnificent floor tiles produced for the palace of Isabella d'Este in Mantua in 1494, represent two well-known surviving examples.

Tiles: Delft tiles in the kitchen, Amalienburg, Schloss Nymphenburg, 1734–39

Tiles in the Arab Hall, Leighton House, London, 1877-79

The Italian maiolica technique spread to Northern Europe at the beginning of the 16th century. In France, Masseot Abaquesne in Rouen made polychrome maiolica floor tiles for the Salle d'Honneur at Château d'Ecouen, near Paris, in 1542 depicting the Montmorency arms. The Italian potter Guido di Savino emigrated from Castel Durante in Northern Italy to Antwerp in Flanders and by 1513 had established a flourishing maiolica workshop in that city. It seems likely that he supplied the fine polychrome pictorial floor tiles for The Vyne, a Tudor mansion at Sherborne St. John, Hampshire, England, where they can still be seen today in the chapel of the house. Several of Guido di Savino's sons moved away from Antwerp and settled in Holland and England. In this way the maiolica technique spread gradually across Northern Europe and by the end of the 16th century it formed the basis for the rise of the Dutch Delftware industry.

The reasons why tiles became such an important building component in Dutch architecture are complex. Replacing wooden houses with brick-built dwellings became a major trend in the larger cities. The expanding economy and lucrative sea trade created wealth which was shared by a much greater section of the population than was the case in other European countries. A large prosperous middle class could afford small but well-built houses decorated with tiles. If in the 15th and 16th centuries maiolica tiles had been mainly used on the floor, the Dutch began to use their tiles on the wall. The demand for tiles led to the establishment of tile factories throughout Holland and, by the beginning of the 17th century, they were being made in towns such as Rotterdam, Delft, Haarlem, Amsterdam, Utrecht, and Harlingen in Friesland.

Diverse practical reasons informed the application of tiles in the Dutch domestic interior. Many houses in towns and cities stood alongside canals, which made the cellars damp. Cellars were therefore lined with tiles to keep the damp out and make them more hygienic storage places. Open fireplaces were lined with tiles to make them more fireproof, and the glazed tile surface helped to reflect the heat into room. In many houses the skirtings were tiled to close the gap between the floorboards and the wall so as to keep out vermin and make cleaning easier. Kitchens were tiled to create waterproof and hygienic surfaces. And as walls were often painted with white-wash that brushed off on clothes, narrow areas such as staircases were frequently lined with tiles.

In addition to these practical motivations, the tiles in Dutch houses also created opportunities to create aesthetically pleasing surfaces by decorating them with patterns and scenes. Many different types of subject matter developed throughout the 17th century, ranging from animals and flowers, to scenes from daily life, ships, landscapes and children's games. The early 17th century tiles continued to be painted in polychrome under the influence of the Italian maiolica technique, but with the importation of and fashion for Chinese blue-and-white porcelain, Dutch potters adopted a blue-and-white palette. This gave rise to what is now the popular conception of the blue-and-white Dutch Delftware tile.

Dutch tiles were made in large numbers not only for the home market, but also for export abroad, and they were frequently used as luxury items for the decoration of palaces and castles in France, Germany, Poland, Russia, Portugal, Denmark, and Britain. The fashion for Delftware tiles in

palaces was much encouraged by their use in Louis XIV's Trianon de Porcelaine at Versailles in 1670 and the Pavillon des Bains at Château de Marly in 1688. Dutch tiles were also used on a large scale at Château de Rambouillet between 1715 and 1730 by the Comte de Toulouse in his Salle de Faïence, which included large seascape panels by the Rotterdam tile-painter Cornelis Boumeester.

Nor was it only in France that kings and the aristocracy favoured Delftware tiles. In Germany there are sumptuous early 18th century tiled interiors still extant in the Schloss Falkenlust, Brühl, and in Munich the pavilions in the park of Schloss Nymphenburg feature elaborately tiled rooms and kitchens. Opulent tiled interiors using Dutch tiles also became part of the early 18th century palaces erected by Peter the Great in St. Petersburg, Russia. Rooms were covered in tiles from top to bottom, including the ceilings, as surviving examples at the Menshikov Palace and the Summer Palace show.

In Britain the use of Delftware tiles was more modest. Queen Mary commissioned the French architect Daniel Marot to design a Water Gallery at Hampton Court decorated with large blue-and-white tiles made at the Grieksche factory in Delft in 1689. During the 18th century English potters produced their own versions of Dutch tiles in London, Bristol and Liverpool. These tiles were used in fireplaces and wash-basin alcoves and sometimes as signs for inns and coffee shops, but the production of English Delftware tiles was small in comparison to the Dutch output.

Portugal developed its own distinct tile culture during the 17th and 18th centuries and tiles were used on a large scale in the interiors of palaces, hospitals, convents, and churches. Their treatment of tile design is more monumental and is better-suited to the decoration of large expanses of wall. The tiles at the 17th-century Fronteira Palace, Benfica, Lisbon, and the 17th and 18th century tiles at the Convent of Madre-de-Deus, Lisbon are important examples *in situ*. In the second half of the 19th the Portuguese used tiles as an exterior cladding for buildings on a large scale.

In Central Europe as well as Scandinavia the tiled stove was a permanent feature of many interiors, providing sustained heat during the cold winters. Ceramic stove tiles are very thick and were often made with a surface moulded in relief to create a larger surface area and thus provide increased heat radiation. Stove tiles were commonly decorated with moulded and painted images, providing an added aesthetic feature to the stoves.

The great ceramic traditions of the Middle East had already influenced tile production in Spain in the 14th and 15th centuries, but major new developments were created with the formation, establishment, and expansion of the Ottoman empire during the 15th, 16th and 17th centuries. The painted pottery and tiles made at Iznik, Turkey, are one of the great cultural products of that time, and were used with great effect in the interior decoration of the Topkapı Palace in Istanbul. Thousands of tiles cover the walls in the Harem and other parts of the palace as well as the interiors of pavilions in the palace gardens. Ottoman tiles exerted a great influence on late 19th century European tile design when the infatuation with all things oriental had a marked effect on European art, architecture, and design.

Great changes were brought about by the Industrial

Tiles: display for Minton at the 1876 Philadelphia Exhibition

Revolution which had far reaching implications for the manufacture, decoration and use of tiles. Already in 1756 John Saddler in Liverpool had perfected a method of printing on tiles which would eventually replace the traditional method of hand painting. By 1770 Wedgwood had perfected his cream-coloured Queen's Ware which was a ceramic body stronger, denser, and more hard-wearing than the soft earthenware body of Delftware. Wedgwood also made cream-coloured tiles from this new type of glazed earthenware suitable for use in dairies and baths. With the invention of better clay bodies, new machines, and production techniques, great transformations in the tile industry took place in the 19th century. The tile manufacturer Herbert Minton led the field, and British technology spread throughout Europe where machine processes developed in Britain were adopted by the tile industries of Germany, France, and Belgium.

Minton exploited an invention by Samuel Wright of Shelton made in 1830 for manufacturing inlaid (a 19th-century term for this type of tile is *encaustic*) floor tiles. At first their main use was in the field of ecclesiastical architecture, but soon it spread to other building types such as domestic housing, town halls, and hospitals. The encaustic tiles made by Minton were very durable and were decorated with a great number of different designs or could be custom made to carry emblematic devices or inscriptions. The Gothic Revival architect A.W.N

Pugin used them in his churches, but he also made lavish use of them in the decoration of the new Palace of Westminster and his own house The Grange in Ramsgate. By the late 1860s the applications of encaustic tiles had become so widespread that Charles Locke Eastlake was able to recommend them unreservedly in his *Hints on Household Taste* of 1868 for use in the domestic interior.

In 1840 Richard Prosser patented a method for dust-pressing clay. This invention was again exploited by Herbert Minton who bought a share of the patent and adapted it to the manufacture of wall tiles. Dust clay is compacted in a tile press under great force, creating a perfectly formed blank which requires little drying time and on which, after the biscuit firing, patterns or illustrations can be printed or painted directly. Tile presses were capable of a large output which meant greatly increased production. Tiles could now be mass produced and decorated with printed or machine moulded patterns. Their price now came within the reach of most householders and this is why the explosion of tile making in the Victorian period, combined with improved standards of hygiene, led to such widespread usage in all types of buildings.

In the 19th-century home they were used in the bathroom, the kitchen, and in the cast-iron grate, while encaustic floor tiles graced the hall. They were used extensively in such buildings as fishshops, butcher's shops, dairies, public houses, hospitals, schools, and libraries. Tiles were also used in furniture like wash stands, chairs, sideboards, and umbrella stands.

If Minton & Company in Stoke-on-Trent had dominated the early years of Victorian tile production, other firms came on the scene in response to an ever growing demand. Maw & Company, which was founded in 1850, had grown into one of the biggest tile companies in Britain by the 1880s. Their purpose-built tile factory at Jackfield, Ironbridge, Shropshire, had an output of millions of tiles supplying a large cross-section of customers.

On the Continent, machine-made tiles were produced in large numbers by the German firm of Villeroy & Boch, Mettlach, while in France such firms as Loebnitz in Paris, and Boulenger in Auneuil, became formidable tile manufacturers. The factory accounts of Villeroy & Boch from the second half of the 19th century show that they supplied tiles for the interiors of a diverse range of buildings such as domestic housing, hotels, government buildings, churches, railway stations, museums, schools, factories, banks, public baths, theatres, town halls, post offices, and slaughter houses.

The Arts and Crafts movement, whose ideas were articulated by John Ruskin and William Morris, brought a reaction to unbridled machine production. Ruskin and Morris's romantic and idealistic notions about hand-production also affected the manufacture and design of tiles. Morris & Company imported Dutch tile blanks which they decorated with designs by Burne-Jones, Philip Webb and Morris himself. They also had hand-painted tiles made in Holland according to their own designs for use in the houses decorated by Morris & Co. Such tiles were used in Wightwick Manor, Wolverhampton, and in Morris's country retreat Kelmscott Manor.

William De Morgan, who was associated with Morris & Co., became the Art and Crafts tile designer par excellence. He set up his own tile and pottery workshop and one of his major surviving tiled interiors is Debenham House, 8 Addison Road,

Tiles: hand-painted tile panels with landscape scenes on the walls of the Mountain Daisy public house, Sunderland, c. 1895; also Craven Dunnill tiles on floor, walls and bar; Ironbridge Gorge Museum Library

Kensington, London, where painted tiles with floral patterns and animals enrich almost every room.

The late 19th century Aesthetic movement and its patrons valued not only the handmade tiles of Morris and De Morgan, but they also appreciated imported Iznik pottery and tiles as part of their interior furnishings. A prime example is the Arab Hall at Leighton House, Kensington, constructed between 1877 and 1879 and lined with authentic Turkish tiles. This fascination with Middle Eastern tiles is also evident at Sledmere House, near Driffield, Yorkshire, where the Turkish Room is a copy of the Sultan's apartment in the Valideh Mosque, Istanbul.

Between 1890 and 1914 Art Nouveau tiles became a common feature throughout Europe. Most countries seemed to make their own variety. Many Art Nouveau tiles were machine-made and the decoration pressed into a relief pattern during the production process. They were then decorated with bright opaque or translucent glazes and used with great effect in many turn-of-the century buildings. The architect Antoni

Gaudí made particularly creative use of Spanish Art Nouveau tiles on the exteriors and in the interiors of many of his buildings in Barcelona.

Tile production at the turn of the century represented the last episode in the first machine age of decorative tile making. In Germany, Britain, Belgium and France, World War I brought the manufacture of tiles to a virtual standstill, and after 1918 there was a more pragmatic approach to tile production dictated by changed economic circumstances and different kinds of demand.

During the inter-war period the industrialised countries of Europe adopted increasingly automated processes in the manufacture of goods. Tiles were no exception, and if previously tile presses had been operated by hand or steam, the use of electricity ushered in the emergence of the fully automated tile press. The introduction of tunnel kilns allowed for non-stop production and greater control over the firing process.

Much of the demand at this time lay with the housing industry, and, under the influence of the Modern Movement, the use

of plain tiles outstripped the demand for decorative tiles. In British homes open fireplaces were still much in use, in contrast with the Continent where metal stoves or central heating had become the norm. Fireplace manufacturers in Britain tried to meet demand by adopting prefabrication methods known as “slabbing” which consisted of bedding tiles in plaster or concrete. These slabbed panels could be fixed into position by workmen other than skilled tilers.

The strict functionalism of the International Style was offset by another inter-war phenomenon, Art Deco. Although Art Deco tiles were machine-pressed, they were often decorated by hand using the slip-trail method and brightly coloured glazes, or they were hand-painted. Fine Art Deco tiles were made by Maw & Company and Pilkingtons, while Carter & Company produced several interesting painted tiles series designed by such artists as Harold Stabler and Dora Batty. Craft potters like Bernard Leach produced fine art tiles for use in fireplaces.

After World War II Modernism in architecture continued unabated throughout the 1950s and 1960s. The few decorated tiles that were made were now often screen-printed with abstract motifs. Some exciting designs in this field came from the hands of the Italian designers Ettore Sottsass and Gio Ponti in Milan. Another feature of this period was the involvement of well-known artists in one-off tile schemes, such as Miro's *Wall of the Moon* for the Unesco Building in Paris, or Matisse's tile decorations for Chapelle du Rosaire at Vence, near Nice.

The revival of the hand-decorated tile developed in parallel with the emergence of Postmodernism. This has resulted in a two-tier market. On the one hand there is a market for a more discerning customer whose demands, mainly for the domestic interior, are catered for by a growing body of small potteries and studios specialising in well designed, hand-made tiles. On the other hand there is still the mass-produced tile for popular consumption increasingly supplied by Spanish and Italian manufacturers.

The scope for using tiles as a functional and aesthetic medium in the interior and on the exterior of buildings is still as great as ever. The present-day tile designer also has a vast history of examples to draw on, which, if properly recognized and acknowledged by architects and interior designers, will ensure a creative future for this particular medium in the decorative interior.

Toiles de Jouy

Literally translated as “cloth from Jouy”, the term *toile de Jouy* has become synonymous with monochrome printed furnishing fabrics, usually with a design in red, blue or black on a light-coloured ground. Yet its origins are far more historically specific and relate it to a particular type of fabric (cotton or linen), a particular form of design (monochrome), a particular method of printing (copper-plate), and a particular location (Jouy-en-Josa, France). It is a fabric which has existed, largely unaltered in appearance, since the mid-18th century when the original technique was developed, although in the latter part of the 20th century the methods of production are different.

The origins of the term lie in the establishment of one of the first legal cotton printing works in France: those set up by Christophe-Philippe Oberkampf (1738–1815) in Jouy-en-Josas in 1760 and operational until 1843. Developed on a site halfway between Versailles and Paris, with the status of a Royal Manufacture from 1783, this business manufactured block-printed, copper-plate-printed and roller-printed cottons (after 1797) during its brief existence. While the block prints were the bread and butter of the firm, it is to the copper-plate prints, that Jouy owes its fame – and its survival in the language of interior design today. These prints are well-documented and survive as fabrics, in sample books and in other archival material in the public domain and in the archives of many private collections in Europe and elsewhere. Most firms which now work in this idiom have access to original designs, many of which have been reproduced.

Ironically, given this legacy, Oberkampf began to use the technique of copper-plate printing in Jouy only in 1770, some 18 years after its first application in Ireland and seven years after its introduction in France by Gayet et Mongirod at Sèvres. It was a method of printing which relied on the engraving of fine lines into rectangular copper plates. The size of the

Toiles de Jouy: copperplate-printed cotton depicting scenes from the novel *Paul et Virginie* by Bernardin de Saint-Pierre, c.1795

plate dictated the size of the repeat pattern, and in the case of Jouy, they were usually 92–100 centimetres in length. The plates were placed in a press which was similar to that used for printing on paper, and the dye carried in the grooves of the plate was transferred on to the fabric. Copper-plate prints were characterised by several features: the large scale of their design repeats, the precision of the lines (the shading / hatching imitated exactly the lines of the artist's pen / brush), the use of a single colour and the many scenes incorporating human figures and animals. Extra colours were sometimes added by the use of wood blocks or freehand painted detail.

The pictorial nature of these fabrics probably contributed greatly to their prestige and popularity, as Oberkampff used well-known artists to design them; some 646 such designs were commissioned before 1818 (Bredif, 1989). Oberkampff, and others interested in this medium, also utilised as a source engravings of paintings or illustrations on paper – a medium which had expanded rapidly during the 18th century. Jean-Baptiste Huet is perhaps the best known of the artists who worked for this particular enterprise, and he provided the prototype for such designs as *La fête flamande*, *La liberté*

américaine, *La fête de la fédération*, *Psyche and Cupid*, and a variety of less grandiose schemes of Neo-Classical medallions, cartouches and lozenges. His subject matter was typical of the range of themes chosen for representation, including references to classical antiquity, contemporary political and social events and preoccupations, and a fascination with the orient and with country life.

Today, many high-class furnishing fabric manufacturers worldwide, including Brunschwig et Fils, Cowtan and Tout, Nobilis Fontan, Osborne and Little, and Zoffany, produce so-called *toiles*, in a great variety of patterns, often derived from 18th-century sources. Colourways are more diverse than in the 18th century, with green, yellow, turquoise, terracotta and purple taking their place alongside the more traditional red, black and blue. Methods of production have also changed, with screen-printing replacing the more time consuming process of engraving copper plates. The base fabric may also vary the effect (cotton or linen), and a finishing glaze is sometimes added to give a shiny surface.

The use of *toiles* within interiors has been similarly varied. The legitimate establishment of cotton printing in Europe coin-

cided with the movement away from the *gravitas* and formal etiquette of the French court towards an increasing interest in the pastoral and rural identified in the writings of Rousseau and the milkmaid games of Marie-Antoinette in the Petit Hameau. In this context, the light, airy designs of *toiles de Jouy* became popular as furnishings. In the summer months, in grand houses, they replaced heavier winter wallhangings, upholstery, and loose covers of silk or wool used in winter. Initially, their expense limited them to upper-class houses with walls of suitable dimensions for the large scale of the designs and the erudite nature of some of the imagery. The popularity of *toiles* did not cease with the Ancien Régime, but continued into the 19th century. It was used, for example, in the Empress Eugénie's bedroom at Compiègne in the mid-1850s. Into the 20th century, *toiles* have coexisted alongside more modern French designs in some of the more expensive ranges of furnishing fabrics (often with coordinated wallpaper). Neither their production nor consumption is, however, limited to France. Features in such glossy magazines as *World of Interiors* testify to their international appeal and to their appropriateness for bedrooms or private apartments rather than more public living spaces.

LESLEY ELLIS MILLER

Selected Collections

Large specialist collections of Toiles de Jouy textiles are held in the Musée Oberkampf, Jouy, and the Musée de L'Impression sur Etoffes, Mulhouse. The Mulhouse museum also contains four of the Jouy factory's pattern books; additional pattern books are held by the Musée des Arts de la Mode, Paris, and an important collection of designs and preparatory drawings by Jean-Baptiste Huet is in the Musée des Arts Décoratifs, Paris.

Trains

From the initiation of the celebrated Stockton and Darlington Railway in 1825 – the first steam-powered public railway – the idea of a passenger service took a few years to mature. By 1830 a railway line between Bodmin and Wadebridge in Cornwall provided an early attempt at passenger seating in the form of open front-facing timber benches reminiscent in shape of domestic fireside settles. In September of that same year, the opening of the Liverpool and Manchester passenger service took place and the United States inaugurated its own first railway. The flood gates were then opened to rapid development in Europe, North America and beyond, with intense competition accelerating the transport revolution. The design of carriages evolved within the scope of a limited range of alternative layouts which have been used with relatively little change over the whole of rail history.

In Britain and the rest of Europe separate compartments were introduced from 1834. The earliest examples were built by Nathaniel Worsdell (1809–86) for the Liverpool and Manchester line. The exterior of these vehicles resembled three horse-drawn coach bodies combined on a four-wheel truck but still fitted with the traditional coach seating arrangement. The first royal carriage, built for Queen Adelaide by the London and Birmingham Railway in 1842, followed this design and is now preserved in the National Railway Museum at York. More open saloon arrangements were preferred in the United States so that freedom of movement and sociability could enliven long journeys and relieve tedium.

A pioneer in the field of passenger comfort and a great innovator was George M. Pullman. He produced his first sleeping car in 1859 and was able to negotiate passage of these cars from one line to another, thereby reducing the need for frequent changes of train and all the attendant inconvenience. Georges Nagelmackers, an engineer from Belgium, absorbed these American ideas and incorporated them with his own when he returned home to establish the Compagnie Internationale des Wagons-Lits, aimed at providing luxury travel in Europe. His enterprise resulted in the first Orient Express from Paris to Istanbul in 1885. Sleeping cars had been developing in conjunction with the railway systems which were covering lengthening distances in many parts of the world. Those designed by Samuel Sharp, built in Hamilton, Ontario for the Great Western Railway (GWR) of Canada (1857), predated and could have inspired Pullman's work. In Britain, London to Scotland night trains ran first class sleeping cars from 1873. Dining cars providing meals *en route* were introduced from 1863 on the Philadelphia to Baltimore line, from 1876 by the GWR of Canada, and from 1879 on the London to Leeds line. Pullman "Hotel Cars", with sleeping, dining and kitchen accommodation ran in the United States from 1867, with Canada and Britain following suit in the next few years. Gradually more innovations were introduced – vestibule car connections, gas lighting, vista-domes (Canada), corridor cars,

electric lighting and steam heating, all added to passengers' convenience.

Royalty in Europe had taken readily to rail travel as soon as it was available and Queen Victoria's comfort had already been considered in 1840 when the Great Western Railway began to anticipate her use of their line and produced a 21-foot, three-compartment carriage for Queen and Consort. This was fitted up by a Mr. Webb of Old Bond Street, and, according to contemporary newspaper reports, it had a saloon "handsomely arranged in the rich style of Louis XIV ... with rich crimson and white silk and exquisitely executed paintings, representing the four elements by Parris". Other railways were quick to emulate the Great Western, the Great Northern providing, in more English style, a carved walnut table, pale green silk curtains and a dark maroon carpet with a pattern echoing that of the House of Lords. The New Royal Southampton Railway Carriage had interior wall hangings in drab silk damask, a white silk ceiling with crimson velvet and silver relief motifs of rose, shamrock and thistle – the national emblems of the United Kingdom – and peach window draperies, tasselled and fringed. The Kent and East Sussex Railway made its own contribution to the Royal Saloon range in 1848. Yet another coach for the Queen was built by the London and North-Western Railway in 1869, an example of the High Victorian interior executed within the necessarily long and narrow dimensions of a railway carriage. It featured well-padded Saxe-blue watered silk upholstery and a padded paler blue upholstered ceiling, deep honey-coloured woodwork and a light blue carpet over-patterned in red. It was Queen Victoria's favourite Royal Saloon; she used it for many years, and it is now exhibited at the National Railway Museum as one of the gems of the collection.

Public First Class carriages were also extremely ornate during the 19th century. This was particularly the case in North America where Raphaelesque, or Second Empire, classical motifs and arabesques were complemented by luxuriously padded button-backed upholstery, curtains, blinds, light fittings and even potted plants. Decorative styles in European trains were less florid but comfortable and well appointed for long-distance journeys. Wagon-Lit stock was in use for sleepers and restaurant cars, and in 1903 a new series of Sud Express saloons running between Paris and the Spanish frontier achieved "a serene and restful atmosphere" by way of its mahogany and American birch woodwork, grey self-coloured embroidered wallcoverings and thick carpeting patterned with briars and ferns. Pullman cars ran on the Midland line from London to the North, and their popularity from 1874 onwards justified the supplements payable for their extra comfort. The Southern Railway adopted these cars on the London to Brighton line in 1908, and from 1929, the celebrated Golden Arrow all-Pullman train ran between London and Paris.

Train interiors followed general design trends rather slowly, being subject always to constraints of space and technical policy. Railway companies inevitably prioritised the locomotive and engineering aspects of their enterprises, with the result that interior designs changed slowly and were often quite conservative. A few elements of Art Deco found their way into the railway world in the 1930s, sometimes subdued as in the streamlined Milwaukee Road steam train Hiawatha (1935). In Britain an eccentric venture into modern design by Oliver

Bulleid appeared in the Bognor Buffet cars (1938) where black-edged scalloped tables, counter and structural ribs gave a strange effect, exceeded only by that of the Southern Railway's later mock-Tudor Tavern Cars (1949) complete with oak beams and diamond leaded window panes. Greater success had been achieved with interior design and decoration when the London and North Eastern Chief Mechanical Engineer, Nigel Gresley, had called for outside professional design advice from White Allom Ltd. on new carriages for the Flying Scotsman (1928) and later for sleeping cars (1930–31) for which Waring and Gillow's schemes were accepted. Another specialist firm, Trollope and Sons, dealt with the furnishings on the Great Western's Plymouth boat trains during this period, incorporating modern walnut veneers, stippled vellum ceilings, Wilton carpets, silk damask curtains and separate armchairs.

The extent to which "good" design, applied throughout an integrated transport system, could change public and management perceptions and morale was demonstrated under Frank Pick at London Transport after 1935, and this experience was brought to bear on the policies of the British Transport Commission's Design Panel, set up in 1956 some years after nationalisation in 1947. An exhibition of new prototype carriages at Battersea in 1957 produced a number of practical and unified designs. These represented a new generation and a fresh approach created by British Rail itself at Doncaster, by Cravens Ltd. and, for Birmingham Carriage and Wagon, by Sir Hugh Casson. All relied on simpler lines, good quality serviceable materials and the forward-looking impetus for which the 1951 Festival of Britain was in part responsible. New carriages for the Pullman Car Company also benefited from the Design Panel's advice in 1959 and electric trains for Glasgow, from the drawing boards of the Design Research Unit, again proved the value of good design in terms of enthusiastic passenger approval and increased ticket sales. British Rail continued with its Design Panel policy and much good work was achieved by designers Wilkes and Ashmore, with close attention being paid to heating, lighting and ventilation, and to ergonomical considerations, luggage racks, and small but important details such as rubbish disposal and ease of cleaning.

Luxury still holds a fascination, and two outstanding recent examples of railway carriage design form a suitable tailpiece to this survey. The first, claimed as being the most luxurious train in the world, was the Blue Train in South Africa, which had 5-star hotel ranking and compartments all arranged as private rooms, including three with private baths. On the 26-hour journey, passengers were reported as dressing formally for dinner in the evening. The second example is less ostentatious but nevertheless an impressive instance of modern design and furnishing for an elegant double saloon Pullman car. It was designed by Uli Huber, Teo Jakob and Charles Keller, and was built especially for the Swiss Railways to be used by Pope John Paul II during his 1984 visit to Switzerland.

Trompe-l'Oeil

Derived from the French verb *tromper*, meaning to deceive or trick, the term *trompe-l'oeil* refers to the use of illusionistic effects to simulate the appearance of three-dimensional objects, patterns or materials on a two-dimensional surface. Its aim is to fool observers – momentarily at least – into believing that what they are looking at is real when in fact it is only an image or representation. The technique has been used in various ways and in several different media including inlaid furniture, printed wallpapers and textiles, and even on stone and wooden floors. It is most often, however, associated with painted decoration, where it falls into two broad categories: the imitation of architectural features and materials, and the depiction of figures, landscapes and other representational scenes. Its appeal has been based on its ability to surprise, amuse or shock, and also on the straightforward delight in painterly skills and sophisticated decorative effects. The heyday of *trompe-l'oeil* decoration occurred in Italy during the Renaissance and Baroque periods but it also proved popular at various times in later periods, and a taste for *trompe-l'oeil* painting has resurfaced among certain interior decorators today.

The earliest examples of *trompe-l'oeil* decoration appear in Etruscan tombs, such as the Tomb of the Monkey, Clusium (Chiusi), which date from the last few centuries BC where attempts were made to treat architectural features in three dimensions to give the effect of sloping ceilings and false doors. The probable reason for such effects was the desire to re-create a familiar and apparently more spacious and pleasant background to a joyful after-life. During the first century AD, the walls of Roman villas were painted with complete architectural schemes of dadoes in marble, pilasters, architraves, friezes and formalised motifs surrounding painted panels of mythical or historic subjects and false windows and doors through which gardens, landscapes or further ranges of additional buildings appear. Wall surfaces in Livia's Villa and the Farnesina House in Rome (both now in the Museo Nazionale) were treated in this way, full of colour and skilfully executed. The House of

the Vetii, Pompeii, dating from before the eruption of Vesuvius in 79 AD, took this style of decoration even further, with an upper storey containing painted representations of galleries and figures who looked down on the real inhabitants of the house below. Pliny the Elder's story about a bird that attempted to peck at painted grapes also indicates that *trompe-l'oeil* was a familiar aspect of painting during the classical period.

The use of hieratic and stylised treatments characteristic of Byzantine and medieval art ran counter to this trend, but from the Renaissance artists sought to revive and improve upon the classical tradition of realism. Their efforts were also greatly encouraged by Brunelleschi's formulation of the rules of perspective which were used to great effect in Masaccio's paintings at the turn of the 14th and 15th centuries, particularly in the delineation of architectural features and the accurate use of shadows. These works and the paintings of Northern European artists such as Jan van Eyck were not intended to deceive the eye, but they represent important steps forward in the pursuit of an increasingly realistic depiction of the natural world which was essential for the development of *trompe-l'oeil*.

Around the same time there was growing interest in grisaille painting which was often used on the reverse of triptych altarpieces. Nicolas Froment painted two grisaille panels in 1475 on a triptych in Aix-en-Provence Cathedral which represented stonework niches containing sculptures of Gabriel and the Virgin Mary crowned by late Gothic style canopies. Grisaille, which Larousse defines as "different mixes of black and white to give perfect imitation of bas reliefs" is a highly effective *trompe-l'oeil* component which had overtones of the heroic world. Its monochromatic palette lent contrast and emphasis in contexts which were usually dominated by naturalistic colours. Trophies expressing military or musical themes, or picturing harvesting, gardening or building implements, were all well-suited to grisaille rendering executed in the *trompe-l'oeil* manner. Niches and arcading were favourite subjects and could readily lead the eye into imagined larger interior spaces, although on a limited scale.

Intarsia, a type of decoration formed out of inlaid wood veneers was another popular *trompe-l'oeil* medium. It was used extensively on furniture from the 15th century and during the Renaissance period it was also used to decorate the panelling of studioli, imitating the appearance of cupboards whose doors stood open to disclose every detail of their contents and interiors. Such rooms were masterpieces of the wood-cutter's art and were extremely striking. The degree of illusionism is sometimes breathtaking, leaving an impression that the room really is lined with half-open cupboards containing real objects. One of the earliest and best-known examples was executed for Duke Federigo da Montefeltro in the Palazzo Ducale, Urbino (after 1477).

With the flowering of the Renaissance, Italian artists achieved new levels of virtuosity, and from the end of the 15th century there was increasing interest in illusionism of all kinds. New steps were taken to extend interior architecture – through the depiction of galleries, balustrades and domes in painted decoration, seemingly created out of thin air – and to build up eloquent artistic statements that greatly enhanced the appearance of the interior. Andrea Mantegna's decoration of the

Camera degli Sposi in the Palazzo Ducale, Mantua (1470s) initiated this trend, dissolving real and imagined architecture in a scene that included a pageant of contemporary courtiers looked down upon by putti who appear to lean over a circular balustrade in the frescoed ceiling. In Baldassare Peruzzi's Hall of Columns in the Palazzo della Farnesina, Rome (1518–19), architectural perspective was used to create an illusion of reality in the representation of columned loggie, flanked by statuary in niches, which lead out onto convincingly realistic views of the Roman landscape beyond. The absence of figures in Peruzzi's frescoes makes the illusion of fictive architecture and extended space all the more plausible. The natural conclusion of this tradition of *trompe-l'oeil* architecture was Charles-Louis Clérissieu's remarkable Ruin Room in the monastery of S. Trinità dei Monti, Rome (c.1766), which was painted in shades of reds, blues, greys, and greens to resemble an ancient ruin complete with crumbling walls, with decorative and architectural details and a ruined vaulted ceiling.

The desire to extend the confines of the room reached new heights in the mid- and late 16th century in the work of Mannerist painters such as Giulio Romano whose Sala dei Giganti in the Palazzo del Te, Mantua (1525–35) involved the disintegration of the divisions between the ceiling and the wall. The viewer is entirely surrounded by an apocalyptic scene of giants battling amidst tumbling buildings while cloud-borne deities look on from above; the sense of chaos and vigorous action is almost overpowering. Illusionistic trends in monumental figure painting culminated in the work of artists such as G.B. Tiepolo whose decorations in the Palazzo Labia, Venice and later in the Würzburg Residence, have a weightless, airy quality that seems to defy the ordinary conventions of architectural space. Similarly dramatic effects were also visible in the contemporary Villa Lechi, Brescia (1741–45) where splendid sweeps of Bibiena-like staircases, painted by Giacomo Lechi and Carlo Carloni, adorn the ballroom walls.

Although French artists were familiar with illusionistic decoration, the Renaissance delight in dissolving architecture or conversely in creating realistic buildings in two-dimensions did not attract a wide following in France. Fantasy made a modest appearance as part of the French Baroque style in examples such as Francesco Romanelli's decoration in the Palais Mazarin (1646–47) and the Salle des Saisons in the Louvre (1655–57) but no strong tradition of *trompe-l'oeil* mural painting developed.

A few good examples of illusionistic wall painting appeared in England, with Antonio Verrio's Heaven Room at Burghley House, Stamford (1695–96) setting the standard. Verrio's earlier work at Windsor Castle, based on the Order of the Garter, was unfortunately destroyed, but Sir James Thornhill's Painted Hall (1708–12) in the Royal Hospital, Greenwich, remains as a fine example of an interior where the use of grisaille and polychrome decoration is carefully balanced in relation to the overall architectural setting devised by Christopher Wren and Nicholas Hawksmoor. Louis Laguerre also achieved success with a mixture of grisaille and full *trompe-l'oeil* at Blenheim Palace, (c.1720). *Trompe-l'oeil* effects in another medium exist at Harewood House, Yorkshire, where Thomas Chippendale produced carved wood versions of complicated draped and tasselled pelmets as part of Robert Adam's design for the Library of 1761.

With a general lessening of interest in the creation of grand apartments of parade, painters' illusionistic skills found expression in the smaller scale of easel paintings. They still pursued ultra-realistic subjects, but the results played a less prominent role in the overall design of the interior. Painted cabinets with their contents, pictures of pictures, and novelty pictures sometimes showing torn canvas or broken glass all illustrate the artistic urge to trick and manipulate the viewer's reactions. And, dating from much earlier, *Vanitas* reminders of mortality were still popular. Dutch painters had always excelled in this tradition and Cornelis Norbertus Gysbrechts, active in the third quarter of the 17th century, showed an outstanding talent for *trompe-l'oeil* renditions of everyday objects.

None of the more progressive design movements of the 19th and 20th centuries have proved sympathetic towards the illusory character of *trompe-l'oeil* decoration. Indeed, much design theory from the Gothic Revival onwards stressed the idea of "honesty" in construction and "truth" to materials, and within this context the visual tricks involved in *trompe-l'oeil* were perceived as either morally deceitful or a sham. More mainstream tastes, however, continued to be beguiled by the possibilities of *faux* stone or woodwork. Marbling and graining, which had been popular in many high-class interiors since the mid-18th century, became even more widespread in the mid- and late 19th century, particularly for halls and stairways. Such effects were also imitated in printed wallpapers, as were patterns simulating the appearance of ceramic tiles and stucco mouldings. The fashion for easel painting in *trompe-l'oeil* was also kept alive in the United States by W.M. Harnett (1848–92) and J.F. Peto (1854–1907), although it attracted only limited interest.

A few 20th-century British artists have received commissions for *trompe-l'oeil* murals, notably Rex Whistler who executed a number of important works before his untimely death in World War II. His decorations at Porte Lympne, Kent (1933–34), Plas Newydd, Anglesey (1936–38) and Mottisfont Abbey, Hampshire (1938–39) all contain elements of grisaille and *trompe-l'oeil* within the context of architectural or pastoral fantasies portrayed in a light and whimsical manner. Graham Rust is a more recent exponent of this genre whose virtuoso treatment of the ceiling over the staircase at Ragley Hall, Warwickshire (1969–83) represents a modern interpretation of an historic tradition. Unusually, this work depicts a religious subject – the Temptation of Christ – within a secular setting, but it follows historical precedents by including recognisable family figures leaning over a balustrade in a Baroque-style setting that pays homage to James Gibbs's work in Ragley Hall executed more than two centuries earlier.

Similarly, several up-market interiors in the United States, including Pompeian-style decorations in the J. Paul Getty Museum, Malibu, and some vernacular schemes in Colonial Williamsburg, have been decorated in a *trompe-l'oeil* style. More often, however, such treatments are restricted to scaled-down effects such as Neo-Classical *faux* marble entrance halls or false windows with painted views that are better suited to the size and requirements of city apartments or town houses. Mass-produced imitation pilasters and entablatures in varying degrees of correctness can also supply the demand for a quick and easy facelift, but are obviously a far cry from the effects in

the Palazzo della Farnesina or the Palazzo Labia. The time and expense involved in large-scale *trompe-l'oeil* painting prohibits the possibility of a full-scale revival, but the extra intensity provided by its qualities of illusion and surprise should ensure its continued – albeit limited – presence within the more exclusive interior designer's and artist's repertory of techniques and skills.

Tubular Steel Furniture

Furniture made from nickel or chrome-plated steel tubing did not enter the living room until after World War I. Although iron or brass tubing had been used for chairs and beds before that time, these items were found only in hospitals, barracks or on café terraces. The successful invasion of the home by tubular metal furniture went hand in hand with the rise of modern architecture – new interiors required new, compatible furniture.

The first tubular steel chair was designed by Marcel Breuer at the (Dessau) Bauhaus in 1925, and on Breuer's own testimony was inspired by his new bicycle. However, the chair was actually produced in a training workshop of the aircraft manufacturer Junkers, since Breuer's experience was limited to wooden furniture, while Junkers was experimenting with

metal seats for its aircraft. Breuer's basic aim was to design an easy chair (*Clubsessel*), but without the usual casing of upholstery. The result was a transparent skeleton of steel tubing, with lengths of polished yarn fabric stretched between the tubes to form the seat, back and arms. With its linear pattern of nickel-plated tubing complemented by the austere surfaces of the stretched material, the chair resembled a piece of industrial equipment. The aesthetic concept of this chair, which was given its marketing name of *Wassily* chair by Dino Gavina only in the 1960s, took its inspiration from the work of Gerrit Rietveld: it was an austere, additive composition of elements.

Breuer's subsequent tubular furniture designs were simpler in composition and more in keeping with the specific material properties of tubular steel: elasticity and flexibility. The addition of separate elements was replaced by the curving, continuous, one-piece tubular line. Examples include the model B9 stools (1925–26), the model B10 table (1927) and the model B5 chair.

Although the tubular furniture designed by Breuer was used in the Bauhaus (lecture theatre, canteen, lecturers' houses), it was manufactured at the Standard-Möbel workshop in Berlin. The company was set up for this purpose by Breuer himself and his compatriot Kálmán Lengyel. A further boost to the development of tubular steel furniture was given by the Dutch architect Mart Stam (1899–1986). In 1926 Stam constructed a chair from gas pipes, with no rear legs. The sawn-off sections of pipe were connected with elbow joints. On the ground they formed a U-shaped sledge, rising vertically at the front to seat level and then running back at right-angles in the same U shape to the end of the seat before again rising vertically to form the back. A wooden plank was used for the seat. The result was a cantilever chair with a single through line and a simple Cubist shape. Like Breuer, Stam had no experience with metal. The only possible explanation for his choice of gas pipes is his Functionalist predilection for industrially manufactured material, which evoked no aesthetic associations.

This chair was also the starting point for Stam's cantilever chair design for the interior of his houses at the Werkbund Die Wohnung exhibition in Stuttgart (1927). Mies van der Rohe, who was introduced to the cantilever principle by Stam, also designed a cantilever chair for the same occasion, though not Cubist in shape but with rounded, semi-circular front legs. So, at the opening of the Werkbund exhibition visitors could see two types of tubular chair without rear legs: one with Stam's severely Cubist structure and the other with Mies's elegant curves. There was a further difference between the two chairs. Because Stam persisted in using thin tubing (22 mm in diameter) and sharp angles, it was necessary to reinforce his chair internally, thus destroying the springy effect of the floating seat. The sturdier tubing chosen by Mies (25 mm in diameter), and the semi-circular front feet, gave his chair genuine resilience.

Tubular steel furniture had several qualities that appealed strongly to Modern architects at the time. First, a tubular steel chair was the product not of craftsmanship but of industry. It was made of industrially prefabricated material and was potentially cheap if mass-produced and hence available to everyone. Second, it was hygienic and easy to maintain. And third, it was both physically and optically light and suitable as a standard product for standardised tract housing. In fact

Tubular steel furniture by Mart Stam for the Weissenhofsiedlung, Stuttgart, 1927

tubular steel had all the qualities that were also attributed to Modern architecture. But in practice things proved less ideal. Many designs were produced only in ones and twos or in small runs and were very expensive; even the successful simple cantilever chairs were more expensive than comparable wooden chairs. The actual features of hygiene and lightness were of little importance, but the figurative qualities were all the more so: the transparent tubular furniture fitted into the spatial continuum which the Moderns were aiming for in their designs and the cool, functional look of the steel tubing evoked the image of aesthetic economy and the beauty of machinery. Hence tubular steel furniture – and particularly the cantilever chair whose simplicity and austerity of line also represented a triumph over gravity – like the white, unornamented Cubist buildings, has become synonymous with modernity. It is not surprising that tubular furniture should have been presented to the public at exhibitions of modern architecture. In Stuttgart Breuer, A. Korn, J.J.P. Oud, H. and B. Rasch, and S. van Ravesteyn also exhibited such items, even though the majority of their designs were still conceived in terms of wooden furniture. However, subsequent exhibitions of Modern architecture in Brno (1928), Breslau (1929) and Stockholm (1930) also featured new tubular steel furniture designs.

In 1928 Breuer produced an improved version of Stam's chair, with wider tubing and less sharp angles, which made the chairs more resilient and comfortable to sit in. These were the models B33, B32 (with arms B64), designed for the firm of Thonet, which was preparing to produce tubular steel furniture. In contrast to Stam, who wished to see his chair as the embodiment of the strict right-angled principle, Breuer paid more attention to comfort and elegance. For instance, the B32 and B64 models, which enjoyed lasting success, and were later given the name *Cesca* chair by Gavina, had a typical Thonet seat and back rest: a beech frame with woven cane. Between 1928 and 1930 Breuer produced a further series of designs for additional items of tubular steel furniture: tables, occasional

tables, desks and cupboards, so that the range was sufficient to furnish a complete interior.

Although Breuer's work was crucial to the basic concept of tubular steel furniture, designers in various countries were already experimenting with this type of furniture between 1927 and 1930. The work of Le Corbusier and Charlotte Perriand in particular made a lasting contribution to the genre. However, their designs are different in character, and they were less interested in the material properties of steel tubing. Chrome-plated tubing was used mainly for its aesthetic quality to produce a dazzling composition. The same applies to other French designers like René Herbst or Jean Burkhalter. The only exception is Jean Prouvé, whose designs are genuine mobile sitting machines.

Around 1930 steel tubing became more generally accepted and even fashionable. This meant that tubular steel furniture was no longer restricted to the interior of the severe white buildings of the Modern architects, but reached a wider (affluent) public. The mounting demand prompted the second generation of designers, mostly interior designers and to a lesser extent architects, to produce further variations on standard solutions already achieved. This sometimes resulted in complicated and fantastic designs which Stam deprecatingly dubbed "tubular steel macaroni", and plagiarism was quite common. From 1930 onwards tubular steel furniture also began to attract manufacturers who had originally held back from involvement in the field. The Thonet company was one of the few to assess the future potential of tubular steel furniture correctly as early as 1928. The growth in sales led irrevocably to much copyright litigation, in which Stam's business representative, the Hungarian Anton Lorenz, played a major role. In commercial terms the fashionable designs were of less importance. The largest sales were achieved by simple steel chairs. Their use became so widespread that in Germany, for example, sales continued to rise even after 1933.

Around 1935 fashion swung back to wooden furniture, but

simple tubular metal chairs remained popular as utilitarian objects well into the post-war period, with examples still being used in institutions and more High-Tech environments today. In this way the dream cherished by avant-garde architects of cheap popular furniture was finally realised, though separately from their architecture.

U

Udine, Giovanni da 1487–1561

Italian painter, draughtsman, architect and stuccoist

Giovanni di Francesco Recamador, or Ricamatori, called Giovanni da Udine after the town in which he was born in northern Italy, was a celebrated 16th-century painter, architect and decorative artist. His first biographer, Giorgio Vasari, writing in 1550, mentions his particular skill in representing still-life subjects, animals, cloth, instruments, vases, landscapes, buildings and verdure. And also that he invented a recipe for stucco consisting of ground white marble mixed with white travertine lime in place of the usual pozzuolana. This recipe enabled him to reproduce in interior decoration the forms of classical grotesques that he and Raphael had rediscovered in the ruins of Rome near San Pietro in Vincoli and the palace of Titus. Udine was the great early master of the revived grotesque in paint as well as plaster and he also incorporated their form into the borders and fields of tapestries.

Giovanni was trained first in Udine with the painter Giovanni di Maestro Martino, moving prior to 1510 to Venice where he seems to have taken up the manner of Giorgione; the painting, *Venus and Love* (National Gallery, Washington) is perhaps from this time. He is next heard of in Rome (c.1513) working in the circle of Raphael on the ceiling of the Stanza di Eliodoro and then, a year later, on the still-life details in Raphael's *Saint Cecilia* and on parts of the cartoon of the *Miraculous Draught of Fishes*. From that time on Giovanni played an important role in Raphael's workshop, working most notably on the Stufetta (or bathroom) and the Loggetta for Cardinal Bibbiena, the Vatican loggias (1517–19) and the Loggia di Psiche (1519) at the Villa Farnesina, where according to Vasari he painted in the borders with all manner of fruits, flowers and foliage and also a great quantity of animals in the lunettes, surrounding the festoons.

After Raphael's death, from 1520–27, Giovanni worked with Giulio Romano (c.1492/99–1546) on the "grotesque" decorations at the Villa Madama. He is also recorded in Florence at the Palazzo Medici, from about 1521–27, involved with the decoration of two rooms after designs by Michaelangelo, and he painted glass with grotesque ornament in Michelangelo's Biblioteca Laurenziana in 1526. Also in the 1520s, in Rome, he worked on various temporary displays, most notably at the Castel Sant'Angelo and the Campidoglio,

and then back at the Villa Madama on a project for a fountain and grotto for Pope Clement VII for whom he had decorated a stufetta at the Castel Sant'Angelo.

About 1530 Giovanni seems to have moved his base of operations back to Udine and there are records of work he did on the decorations of his own house on the Borgo Gemona in 1535. There was plenty of work in the area to keep him busy; in 1535 he worked at the church of Santa Maria dei Battuti in Civedale, and in 1539 on some stucco decorations at the Palazzo Grimani in Venice. Also in 1539 he oversaw the reconstruction of the choir of the Cathedral at Udine and in 1547 he was working for Pier Luigi Farnese at Piacenza. In 1552 Giovanni was named public architect for Udine and this led to a range of further commissions; in 1553 for a baldacchino for the parish church of Santa Maria in Carnia; in 1554 for the decoration of the house of Bernardo Maniago in Udine; in 1556 for the decoration of the studiolo at the Castello di Colloredo at Monte Albano; and then various works later at the church of San Lorenzo in Monte di Buia, and at the Cathedral at San Daniele del Friuli. In 1560 he was back in Rome, working on the loggias of Pius IV and, according to Vasari, retouching parts of the first floor of the Vatican loggias. He died in July 1561.

Giovanni's was a busy and not untypical professional life ranging over various fields of work. But he is now remembered for the decorations in the Vatican loggias where he revitalised the Roman grotesque. "Grotesques" was the name given to the newly discovered painted decorations on the walls and ceilings of ancient Roman buildings such as the Domus Aurea of Nero, which were uncovered in the late 15th century. These decorations consisted of circular or rectangular panels containing figures, connected into an overall composition by an elaborate framework or by a thin scaffolding of attenuated architecture, vases, trophies, acanthus, putti, scrolls and so on. Giovanni made a detailed study of the grotesques in the Domus Aurea and of the Roman plasterwork in the more easily accessible Colosseum. His name is scratched in the Domus Aurea near that of Nicoletto da Modena and it was Giovanni who first introduced Raphael to its antique decorations. Together they pioneered a new style of decoration that utilised archaeological motifs combined with inventions of Giovanni's own including real and imaginary animals, flowers and plants, garlands, shells, and fruits. Moralists criticised the use of such inventions as challenging the authority of God's creations. But to patrons

and the public, the co-mingling of real and imaginary and illusionistic elements was irresistible and Giovanni's Roman decorations exerted a powerful influence on taste for more than 200 years. Many examples of his work were reproduced as engravings which were disseminated all over Europe. The decorations at the loggias were engraved by Pietro Santo Bartoli (c.1635–1700), Giovanni Volpato 1733–1803) and Carlo Lasino (1759–1838), while those at the Farnesina were engraved by Nicolas Dorigny (1657–1746).

Giovanni's work was also the source of several later styles. Vasari notes that at the grotto at the Villa Madama, Giovanni added stucco knobs and bosses, cockle shells, sea snails, tortoise shells, and other shells large and small. When such a form of decoration was revived in France in the second quarter of the 18th century it took its name – *rocaille* – from the forms of the shells so prodigally used. Later, as more classical effects became popular, the same antique forms were revived as an important part of Neo-Classical decoration. The decorations in the bath-house built in the early 1770s for the Comte de Lauragais at the Hôtel de Brancas, Paris, and designed by the architect François-Joseph Bélanger, was one of several celebrated examples that clearly owed much to classical prototypes and Giovanni's interpretation of grotesque ornament. Indeed, so popular did this style become that arabesque and grotesque motifs were reproduced in wallpaper and textile in the late 18th and early 19th centuries.

Biography

Giovanni Nanni or Giovanni Recamador. Born in Udine, in 1487, the son of a tailor, Francesco Recamador. Trained under the painter Giovanni di Maestro Martino, 1502–06; perhaps travelled to Ferrara, 1506; worked in Venice, perhaps in circle of Giorgione, c.1506–12; moved to Rome, where he met Peruzzi, c.1513; worked with Peruzzi on church decoration and at the Farnesina, 1513–16; made detailed studies of newly discovered grotesques at the Domus Aurea and the Colosseum; collaborated with Raphael at the Vatican on the second set of loggias, and at Palazzo Madama, 1518–20. Worked in Florence, 1520–22; travelled to Udine, 1523, then returned to Rome to work for Pope Clement VII, 1523–26. Summoned by Michelangelo to Florence to assist on decoration of Biblioteca Laurenziana, 1526; returned to Rome, leaving again for Udine after the Sack of Rome, 1527; worked on various tasks for the Pope and Andrea Doria, 1529–31; in Florence, 1532–33; returned to Udine where he acquired property, 1533. Married Costanza de' Becaris, 1535: 12 children. Commissioned to decorate Palazzo Grimani, 1537–40; elected local councillor in Udine, 1538; provided designs for Murano glass, c.1541; active for Udine Town Council (architect, 1542–49; superintendent of public works, 1552). In Rome, working for Pope Julius III, 1550, when he was appointed Keeper of the Seal; working at Castello di Spilimbergo, 1555; active on decorative stuccoes and paintings in palaces in Udine, 1556–59; in Rome in 1560. Died in Rome, 17 July 1561.

Selected Works

United States

Early buildings of the 17th-century colonial settlements on the North American continent survive in small numbers, generally with the status of carefully preserved "landmarks". The interiors of such buildings have undergone changes over the centuries as owners and occupants altered plans, colors and finishes and replaced furniture as times and styles changed. Efforts to create "restorations" that reproduce the spaces of the earliest colonial buildings are always of uncertain authenticity. What is clearly certain is that settlers arriving in America

USA: north room, Jan Martense Schenck house, Mill Island, Flatlands, Brooklyn, built c.1675

invariably brought with them the ideas and habits that were typical of their places of origin at the time of their immigration.

Since most of the earlier settlers did not come from aristocratic or wealthy families, their ways of building and furnishing were, generally, those of modest peasant-farmers. American houses in the country usually belonged to simple farmers and were cottages or farmhouses typical of one or another European practice of the 1600s which themselves represented the vernacular building of the late Middle Ages, little changed by Renaissance influences. In New England, in the northeast coastlands of America, settlers came from England. In the central colonies, arrivals were from England, Holland, Germany and Sweden. The English settlers of Jamestown, Virginia, arriving in 1607, proceeded to build a town with row houses like those of Oxford, or the villages of the Cotswolds, despite the fact that the open lands of America did not suggest such concentrations of building. Dutch settlers tended to build cottages in stone but, since stone was available only in rough, fieldstone form and brick was available only as an import until brickyards were established, most building was in timber.

As forests were cleared to open agricultural land, wood was generously available and became the primary building material

used by the settlers from northern Europe in the heavy framing system known as "half-timber" construction. The exposed timbers, with infilling typical of European practice, proved impractical in the American climate and, since a wood was readily available, was given up in favor of a wood external skin in the form of wood shingles or wood boards of the kind known as "clapboard". The Hoxie house (1637) in Sandwich, Massachusetts (on Cape Cod) is of this type, with a shingled exterior and tiny windows as a defense against cold and possibly hostile natives. The Whipple house in Ipswich, Massachusetts (1640) has a clapboard exterior and upper floors that overhang those below in the manner of European town buildings of the late Middle Ages. Dutch settlers built houses such as the Jan Martense Schenck house of 1675 (now preserved in restored form in the Brooklyn Museum) with box beds, Delft tiles edging fireplaces and, where owners could afford it, an elaborate wood *kas* (storage cabinet) imported from Holland.

Internally, rooms were much like those of European cottages, with frame members exposed, with floors of wood planks and ceilings of wood beams and boarding. Walls were sometimes plastered, but most often were also of wood boarding, while the essential fireplaces were of brick. Furniture was also of wood, with tables and benches of simple board

construction, while chairs might make use of turnings for legs and back structure, boards for the typical "ladder back" and seats of carved planks or woven rush. Occasional examples of more elaborate chests use design typical of English Jacobean or Restoration period work, often simplified to suit the limited skills of American craftsmen.

The resulting interior, almost entirely of wood, might include some objects such as chests painted in some basic color, often red or green; other color came from rugs, blankets and quilts made of fabrics that might be dyed in color tones. Such simple house interiors were typical of the houses of America from the time of the first Pilgrim landing in 1620 until well into the 18th century. There was, of course, no thought of interior design as a professional area of specialization; all interiors were simply the result of vernacular building techniques furnished with the furnishings chosen by owners and occupants from the limited possibilities available.

Somewhat different vernacular types developed in the more southern colonies where brick building became more common (as in Virginia) or where French settlers brought their own traditions, as in Louisiana and Florida. Spanish settlers introduced still another vernacular tradition into the American south, southwest and, eventually, into California where masonry was more widely used, with wall surfaces stuccoed or plastered. The Palace of the Governors in Santa Fe, New Mexico dates from 1610–14, while the church and convent of San Estevan in Acoma, New Mexico was built between 1629 and 1642. At Laguna, New Mexico the church of San Jose (c.1700) has a handsome interior with plain, whitewashed adobe walls, elaborate carved wood screening behind the altar and wood roof beams overhead, with carved details where they meet the walls.

Furniture in all of these interiors, whatever the European origins of their occupants, was also of simple wood construction, and interiors developed a strictly vernacular quality now often admired and, with doubtful authenticity, imitated in the houses, furniture and other products designated as "colonial" in style.

The designation "French colonial" is used to describe such buildings as the house with surrounding verandas known as Parlange near Baton Rouge, Louisiana (c.1750), while the Cabildo in New Orleans (1799), the work of an identified architect, Gilberto Guillemard, is a public building of quite sophisticated classical design in the idiom called "Spanish colonial".

Other than houses, the only significant buildings were churches and related religious structures and, as colonial wealth increased, town halls and "state houses". The typical religious building of New England was a meeting house, a simple box-like structure with pews for seating but without decorative features in accordance with the attitudes of Puritan religious belief. The "Old Ship" Meeting House in Hingham, Massachusetts (1681) has an austere interior typical of the New England meeting house tradition with exposed wood structural members, pews and pulpit in the colors of the natural wood, and with plastered walls between the wood members.

The few public buildings included town halls, typically similar to the meeting houses with their simple wood structure and unornamented interiors. The Capitol building in

Williamsburg, Virginia of 1704 is an example of a more sophisticated public building in brick by an unknown architect. The existing building is a reconstruction based on scanty evidence in surviving foundations and in an old woodcut illustration. Its highly sophisticated interior detailing may owe more to the restoration architects of 1928–34 than to the original building. The main building of the College of William and Mary, also in Williamsburg, is an anonymous work of 1716, but the design is traditionally attributed to Sir Christopher Wren on the basis of an illustration known as the Bodleian Plate, showing the design for the building thought to have been proposed by Wren.

A gradual shift toward more sophisticated design, as well as the expression of increasing wealth in the American colonies, brought about a transition into what is usually known as the Georgian era, beginning around 1720. As time went on, churches began to appear more closely modeled on European precedents, but still of generally simple, less ornamented character. Awareness of the Wren churches of London and similar buildings in other English cities was introduced into American practice in the 18th century through the importation of such books as Colen Campbell's 1715 first volume of *Vitruvius Britannicus* and James Gibbs's 1728 *A Book of Architecture*. Old North Church (Christ Church) in Boston (1723) with its balconies and simple classic detail suggests a simplified version of a Wren London church. The designer was a cabinet-maker and book dealer named William Price, a semi-professional architect. Philadelphia's Christ Church (begun 1727), with its balconies supported by correctly detailed Doric columns and its Palladian window behind the altar, is thought to be at least in part the work of the amateur architect Dr. John Kearsley, who was also a member of the committee of three responsible for the State House (now called Independence Hall) in Philadelphia (begun 1732), with its Palladian window and stately interiors paneled in typical Georgian fashion.

As the wealth of the colonies grew, an increasing number of large houses were built. Stratford Hall in Westmorland, Virginia, an anonymous work of c.1725–30, is a massive brick building with an unusual H-plan that suggests awareness of Sebastiano Serlio's *Architettura* rather than Palladio, while its interiors are richly detailed and furnished in English Georgian style. A continuing increase in strongly Georgian interior detail represents characteristics that reflected a firm knowledge of the English practice of the time. In Virginia the 1730 mansion of Westover and the great house of Carter's Grove (1750–53), both possibly the work of Richard Taliaferro, are typical, with their detailed interiors and elaborate staircases in carefully correct Georgian idiom.

The churches of the southwest and California were exceptional in their greater inclusion of decorative and symbolic ornament which often suggests the Baroque traditions of Spain. The interior of the church of San Xavier del Bac near Tucson (1775–97), for example, has a cruciform plan and much elaborate plaster detail and a rich altar retablo. The design is credited to Ignacio Gaona, a Spanish architect working for the missions of the region.

In the east coastal colonies with strong attachment to England, the design vocabulary of Georgian England became the norm for the large plantation houses that were often designed by their owners, well-educated "gentlemen" who

USA: parlour, Joseph Russell House, Brooklyn, c.1772

regarded the study of architecture as an important part of their daily concern. From 1743 to 1787 the original farmhouse built by the Washington family at Mt. Vernon, Virginia, was gradually expanded and elaborated until, as the home of George Washington, it became a virtual manor house. Although built of wood, it displayed an imitation stone ashlar exterior and was given such fashionable features as the large Palladian window that dominates the ballroom at one end of the house. Other rooms have carefully detailed mantels and other woodwork and ornamental plasterwork suggesting awareness of the style of the Adam brothers.

Thomas Jefferson's self-taught knowledge of architecture was developed during his travels in Europe. His extensive building at Monticello (1768–82) includes a main house built in brick, and contains a domed rotunda, no doubt inspired by Palladio whose *Quattro Libri* was well known to Jefferson. The interiors revealed a taste for fashionable French architecture and decoration, and several items of furniture had been purchased during Jefferson's stay in Paris between 1784 and 1789.

Smaller "mansions", often quite modest in size and often designed by their owners or by skilled craftsmen, were never-

theless frequently highly sophisticated. Mount Pleasant, for example, a park mansion in Philadelphia (1761–62), has much finely developed detailing and the seemingly inevitable Palladian window lighting its second floor central hall. A room from Samuel Powel's Philadelphia city row house of 1768 is now installed in the Metropolitan Museum of Art in New York. With appropriate period furniture and other artefacts (a tall clock, a candle chandelier) and with one wall covered with an imported painted Chinese wallpaper, it gives a clear sense of what the interiors of the houses of the affluent city dwellers of the era were like.

By the second half of the 18th century, wealthy east coast houses often included finely executed carved paneling and internal woodwork, wallpapers, painted floorcloths, patterned textiles and other luxuries such as imported china and clocks. Styles were strongly influenced by European fashions, and the majority of the better kinds of furniture and upholstery was still purchased in England. One of the most balanced and successful examples of a classically-inspired interior of this period is the parlour reconstructed from the Russell House (c.1772) in the Brooklyn Museum: the paneled walls feature a delicately carved, pedimented overmantel with Corinthian

pilasters flanked by arched niches, the whole surmounted by a deep dentilled frieze. The sparse furnishings in this interior not only emphasise its architectural character but also accord with 18th-century practice when rooms were used for a variety of purposes, and objects and furniture were frequently moved from room to room or even house to house as seasons or requirements changed.

Churches and other public buildings continued to be the work of amateurs such as Peter Harrison (1716–75) who was born in York, England, but came to America in 1739. By 1749 he was making drawings for building projects, although this appears to have been a sideline for which he had no formal training. King's Chapel in Boston (1749–64) is his best known work, with its paired classical columns supporting a balcony and with the obligatory Palladian window above the altar.

It is customary to consider the Georgian era in American design as having ended around 1790, to be succeeded by the Federal period extending until about 1820. Professionalism in architecture began to emerge toward the end of the 18th century, although architectural education still meant either apprenticeship or self-teaching. Responsibility for interior detailing was taken for granted by the full-time professional architect, while choice of furniture and other furnishings generally was left to the owner or other person in charge of a building. Small items were often imported from Europe, but an increasing number of American cabinet-makers, textile printers and other artisans produced work of high quality based on European practice learned at first hand or from books.

Charles Bulfinch (1763–1844), although self-taught, turned professional in 1796 and turned out a number of major buildings in a style that mixed awareness of the work of Palladio, Wren and the Adam brothers. He was the designer of a number of churches and of state houses for several former colonies including Connecticut, Maine and Massachusetts, where the domed and columned Representatives Room (1795–97) is a fine example of his style. He was appointed architect of the United States Capitol in Washington, DC in 1818, taking over a project that had begun with a successful competition entry by another amateur, Dr. William Thornton (1759–1826). The interiors of the Capitol, however, are the work of a true professional, Benjamin Henry Latrobe (1764–1820), who was trained in the office of Samuel Pepys Cockerell in England and who practised in London before coming to America in 1795. The handsome chambers for the two houses of Congress, semi-circular, columned rooms survive, although now with other uses. Latrobe was aware of specifics of Greek architecture and became a significant figure in the development of the Greek Revival in America. His domestic interiors displayed a spatial variety reflecting the geometries of vaulted construction, but were often built predominantly of wood and plaster. Within apparently simple Neo-Classical structures he developed sophisticated picturesque sequences of space and light, as in the John Pope House in Lexington, Kentucky (1811).

The establishment of a democratic system of government in the United States coincided with the availability of books providing detailed illustration of ancient Greek design. In his many books, Asher Benjamin (1771–1845) described and illustrated the details of ancient Greek architecture and offered designs adapting Greek practice to the American scene of his day in terms understandable to an intelligent carpenter. The

related ideas that Greek design represented a high point of aesthetic achievement and that the ancient democracy of Athens was a precursor of the American governmental system formed a basis for an enthusiasm for everything Greek. Temple-like buildings were built for banks, churches and for houses as well, and it became customary to introduce Greek detail into interiors. Latrobe had hinted at this direction with his use of Greek order detail in the Capitol, but the use of Greek detail in the work of William Strickland (1787–1854) is more consistent and more accurate. The Second Bank of the United States in Philadelphia (1818–24), for example, uses a Doric temple exterior and houses an Ionic, vaulted main banking room.

In private homes, Greek mouldings, plaster and woodwork details, and even full columns, became part of the stylish direction of the era. Furniture makers such as Duncan Phyfe (1768–1854) introduced design based on furniture images from ancient Greek vase paintings and added supposedly Greek detail to tables and sofas intended to relate to the interiors of houses that were externally Greek.

The Greek Revival, taking its clues from England, merged into a Gothic Revival beginning around 1830. The architects Ithiel Town (1784–1844) and Alexander Jackson Davis (1803–92), known for their US Customs House, New York, of 1833–42 in Greek Doric temple style (albeit with a domed and columned interior rotunda), made a transition into the Gothic Revival with such projects as the mansion named Lyndhurst in Tarrytown, New York (1838–67), with interiors full of “pointed” detail considered to be Gothic. A more convincingly accurate Gothic vocabulary appears in churches such as New York's Trinity Church of 1841–46 by Richard Upjohn, where the interior is a realistic simulation of an English parish church of the Middle Ages. As Gothic design became fashionable, it filtered down into a country builder's vernacular that came to be known as “carpenter Gothic” with pointed arches and so-called “gingerbread” decorative detail introduced wherever possible.

An enormously influential figure during the middle decades of the 19th century was the writer and designer Andrew Jackson Downing (1815–52), whose pattern books sought to promote what he described as “good taste” for the American middle classes, a section of society that had previously been largely uncatered to by architects. His best-known works were *Cottage Residences* (1842) and *The Architecture of Country Houses* (1850) which discussed the planning, ornament and color of suburban villas and small farmhouses. Numerous dwellings across the United States attest to the impact of these books. Rejecting the classicizing elements typical of public architecture as totally inappropriate for rural dwellings, Downing argued instead for the use of romantic and irrational styles such as Gothic, Italian or Elizabethan. He also promoted asymmetrical and irregular plans on the grounds of convenience, and advocated technical innovations such as indoor plumbing, thereby significantly improving the creature comforts of the middle classes. His writings and plans were widely available, and became prototypes for suburban residences which were reinterpreted many times over throughout the country.

Gradually a mixture of styles became typical of the Victorian era, with ornamental elaboration valued for its own

sake and little concern for its sources or logic. Historians continue to struggle to develop a terminology for the overlapping Victorian styles that drew on Greek, Gothic, French Renaissance and Italian themes while industrialization made elaboration increasingly cheap and available. Furniture makers such as John Henry Belter (1804–63) produced Rococo Revival furniture using newly developed techniques of plywood construction, while inventors developed patented furniture with adjustability and convertibility as functional capabilities. The overriding Victorian aim was for ornamentation along with generally dark and muted color tones and heavy textures. Woodwork, generally in oak, was commonly stained to a dark brown that, along with textured and flocked wallpapers in dull and dark colors, established a Victorian atmosphere of, at least to modern taste, dullness and gloom.

An exceptional alternative to the norms of Victorian taste appears in the design of the religious sect known as American Shakers. The ideals of the Shaker communities involved a respect for efficiency and an orientation toward simplicity and order. As a result, Shaker interiors were typically open and bright, with highly functional furniture in settings that used white walls with occasional strong, near-primary color.

The Craftsman Movement, inspired by the ideas of William Morris, offered another alternative to the elaboration and darkness of the dominating Victorian taste. Gustav Stickley (1858–1942) began the production of simple furniture, usually of oak, that he promoted through magazines and mail order catalogues, generating a style (often referred to as Mission style through supposed similarity to the furniture of the California missions) that had a considerable, although limited acceptance in America from the 1880s until about 1910 when it was pushed aside by an upsurge in another direction in popular taste.

The influence of the Arts and Crafts Movement can also be traced in the work of several California architects, including the brothers Greene and Greene whose houses such as the Gamble (1908) and Blacker (1907) houses in Pasadena had meticulously detailed interiors where wood was used for architectural detail and for furniture in ways that suggest both Arts and Crafts and oriental influences. In the Midwest, the “Prairie School”, including the architects George Elmslie and George Maher, produced work in or near Chicago from the 1880s to about 1900 that showed a parallel craftsmanly emphasis in interior detail.

At about the same time in Chicago, Louis Sullivan (1856–1924) became a significant figure in design history, combining a new emphasis on function as a key determinant in architecture with development of a rich and flowing style of ornament that can be viewed as related to European Art Nouveau. Sullivan’s interiors for the Chicago Auditorium (1887–90) include the highly original opera house that gave the building its name, the various public spaces of the auditorium itself, and the hotel that was a major part of the building. Sullivan continued to develop rich detail for the many small bank buildings he designed for various smaller midwestern cities such as Grinnell and Cedar Rapids, Iowa and Columbus, Wisconsin. Stained glass in strong color and abstract pattern often appeared in windows and light fixtures accenting finely detailed woodwork.

Louis Comfort Tiffany (1848–1933) was a specialist in the

USA: entrance hall, Stephen Decatur House, Washington, DC, by Benjamin Henry Latrobe, 1817

craft of stained glass, but his work included interior elements such as lamps (which usually used stained glass for shades) and furniture. During the early part of his career, Tiffany joined with the painter Samuel Colman, Lockwood de Forest and the needlework artist Candace Wheeler in forming L.C. Tiffany and Associated Artists, a firm of art-decorators that combined expertise in textiles, ceramics, glass and other decorative arts. With Tiffany as director, the company devised overall decorative schemes for many wealthy and fashionable clients including George Kemp and Cornelius Vanderbilt II in New York, and Mark Twain in Hartford, Connecticut. They also provided interiors for several important institutions including the library and veterans’ room in New York’s 7th Regiment Armory. Their work was in the vanguard of Aesthetic taste, a style that proved extremely fashionable for wealthy American interiors during the 1880s and 1890s and that was also taken up by several notable decorating firms such as Herter Brothers and the New York Art-Furnishers Kimbel and Cabus. But Tiffany’s reputation is primarily based on the many objects he created, using glass in ways that reflected Art Nouveau concepts that became widespread in wealthy interiors from the 1890s until about 1910.

Sullivan’s influence is also important in the work of the most famous of American architects, Frank Lloyd Wright (1867–1959). Wright worked for Sullivan and became an important designer in his firm, responsible for much of Sullivan’s detail, before striking out on an independent career.

USA: drawing room, William H. Vanderbilt residence, New York, by Herter Brothers, 1880s

Early work by Wright is strongly reminiscent of Sullivan, but it moved toward decorative detail more geometric than the usual flowing curves of Sullivan's ornament. The nature of Wright's architecture made interiors an integral part of each building, with highly individualistic detail including both built-in and movable furniture. The Robie house of 1909 in Chicago is a recognized masterpiece of Wright's early work, with finely developed interior spaces complete with furniture, including chairs with the high, slatted backs that are typical of his work. The office building for the Larkin Company in Buffalo, New York (1904) had a vast central atrium with surrounding floors of office space equipped with all-metal furniture of pioneering design. Wright's career was interrupted by his years in Japan (1915–21) when he devoted himself to the Imperial Hotel project in Tokyo. Wright's later work after his return to the United States constitutes a virtual separate career.

At the Chicago World's Columbian Exposition in 1893, Sullivan's startling Transportation Building made a disturbing contrast with the other major buildings that were of pseudo-Roman classical style designed by a number of Americans who

had studied at the Ecole des Beaux-Arts in Paris and had brought back to America the fashion for historic imitation promulgated by that institution. Professional architects in the early 20th century turned away from the originality of Sullivan and Wright and became experts in imitation of almost any historical style. What has come to be called eclecticism, the borrowing of any and all past styles, became the norm for architects, and was quickly adopted by interior decorators who were prepared to provide rooms styled to match a building's exterior.

Major buildings, museums, courthouses, state capitols and railway stations had interiors that were the work of their architects. Large firms, such as the New York office of McKim, Mead and White were adept at providing such spaces as the vast main concourse of the old Pennsylvania Railroad station in New York (1904–10, now demolished) designed to imitate the Baths of Caracalla in ancient Rome. Public spaces of the Woolworth Building in New York (1911–13) by Cass Gilbert (1858–1934) combine Gothic and Byzantine themes. The practice of interior decoration which had in the past been largely a

matter of semi-amateur choice of furniture, textiles and color, became in the 20th century increasingly professional, with decorators prepared to provide residential interiors in more or less convincing imitation of historical styles.

Elsie de Wolfe (1865–1950) is often thought of as the first American to be a fully professional interior decorator. Her 1913 book *The House in Good Taste*, itself strongly influenced by Edith Wharton and Ogden Codman Jr.'s *Decoration of Houses* of 1897, set forth goals of escape from the darkness and clutter of the typical Victorian interior in favor of brightness, simplicity and “good taste”, based on the use of carefully chosen antiques and decorative objects placed within, by the standards of the time, simple settings. Colorful chintz fabrics further brightened the de Wolfe interior. Before long other decorators were learning to serve the appetite for eclectic interiors made respectable in the eyes of their owners by the assembly of antiques (or reproductions) to simulate a room as it might have been in one of the European historic styles, French, English or, less frequently, Spanish or Italian.

In 1913 Nancy McClelland (1877–1959) established a decorating service within the John Wanamaker department store in New York, offering professional interior design in combination with the sale of furniture and other items to complete newly built or newly remodeled spaces. Ruby Ross Wood (1880–1950) began a career as an assistant to Elsie de Wolfe but soon established her own decorating practice and publicized her skills through her 1914 book *The Honest House*. Formal training in interior decoration gradually became available in such institutions as the Parsons School of Design in New York and in many colleges and universities where the subject was often made part of programs in what came to be called “Domestic Science”. The practice of basing interior decoration on imitation of historic interiors continued to dominate American work until well into the 1950s. In addition to residential spaces, the public rooms of hotels, the lobbies and auditoria of theaters (most spectacularly in the great movie palaces of the era) were lavish, often exaggerated imitations of historic styles. Even such exotica as Egyptian, Moorish and Oriental styles became commonplace.

In the 1920s and 1930s various challenges to these directions began to surface. Awareness of the styles called *Moderne* that were on display at annual exhibitions in Paris began to influence some interior design work. The emergence of the profession of industrial design, with its interest in both functional performance and the aesthetics of “streamlined” vehicles and aircraft, became a source for interiors, more often commercial than residential, in a style that has come to be called Art Deco. The building of skyscrapers, newly built railroad trains and aircraft, modern hotels and restaurants as well as retail stores all seemed to call for something other than slavish imitation of historic interiors. Some interior decorators began to produce Art Deco work, while industrial designers became increasingly active in interior design.

Donald Deskey (1894–1989) was a designer of furniture, lamps and other decorative accessories but soon took on commissions designing the interiors of apartments and houses. His interiors for the Mandel house on Long Island, New York were a showcase of Modernistic design. The interiors of the vast Radio City Music Hall in New York (1932) are among the best surviving examples of the Art Deco era. In combination,

the ideas of streamlining and the Art Deco style became the norm for the practice of such industrial designers as Raymond Loewy (1893–1986: Pennsylvania Railroad cars of 1938) and Henry Dreyfuss (1904–72: New York Central Railroad cars, 1936–38). Specialized interior design departments in the offices of these and other industrial designers became active in such work as retail store interiors and exhibition projects. The World's Fairs in Chicago in 1932 and New York in 1939 became showcases for such Modernism, while college-level training in industrial design was introduced in American schools including Carnegie Institute of Technology in Pittsburgh and Pratt Institute in Brooklyn during the 1930s.

Direct influences from Europe were brought to the American scene with the arrival of immigrants such as Joseph Urban (1872–1933), Paul Frankl (1887–1958) and Eliel Saarinen (1873–1950). Urban came from Austria in 1911 and was designer of remarkable interiors for the Ziegfeld Theater and the New School for Social Research, both in New York. Frankl arrived from Vienna in 1914, and was active in residential interior and furniture design. Saarinen came from Finland to head the Cranbrook Academy of Art in Bloomfield Hills, Michigan in 1932 where he was the designer of the school's buildings and their interiors.

Also in the 1930s the influence of a more rigorous functionalist direction based on the ideas of Bauhaus teaching was brought to America by several architects whose work can be characterized as International Style, with the avoidance of all ornamentation and with such typical elements as flat roofs, large areas of glass and, most often, white walls. These Modernists rejected the commercialism of Art Deco and streamline design and designed interiors for their projects in a more purist vein. Examples of this direction include Richard Neutra (1892–1970) from Vienna whose 1929 Lovell “Health House” in Los Angeles was a striking early example of functionalist Modernism. William Lescaze (1896–1969) from Switzerland produced, in collaboration with the American George Howe, the first modern skyscraper in America (indeed the first in the world) for the Philadelphia Saving Fund Society in 1929–32. Its main banking room, other public spaces and many private offices are still among the finest examples of early Modernism in the United States. R.M. Schindler (1887–1953) from Vienna worked for a time with Frank Lloyd Wright before establishing his own practice in Los Angeles, where he designed a number of houses with consistently modern interiors that often suggest De Stijl influence with their complex Constructivist forms.

With his return to America in 1921, Wright developed a second career. At his estate Taliesin in Wisconsin, he gathered a group of younger apprentices and accepted many commissions, including both residential and other, larger buildings. Wright's buildings always developed from interior space concepts, and he controlled every detail of the interiors to the maximum extent possible. The famous house over a waterfall, Fallingwater, in Bear Run near Pittsburgh (1936–39) is probably the most famous of Wright's houses. The combination of concrete and glass, suggestive of the International Style, with the use of stone, wood and other natural materials achieves a remarkable sense of unity and comfort. The office building and research tower for the S.C. Johnson Company in Racine, Wisconsin of 1936–46 includes one of the most remarkable

interior spaces of the modern era. The “great room” of the office building is formed by a cluster of concrete columns that enlarge to disc-shaped tops that form a roof with glass filling the spaces between the discs. Wright designed special furniture for the project in which circles and half circles are dominant forms.

Modernism in America was advanced by the arrival of several noted European architects who became important teachers and practitioners just before and just after World War II. Walter Gropius (1883–1969) at Harvard University, Ludwig Mies van der Rohe (1886–1969) at the Illinois Institute of Technology and (more briefly) Alvar Aalto (1898–1976) at the Massachusetts Institute of Technology brought about a drastic change in architectural education, as Bauhaus ideas of Modernism replaced the previous eclectic directions. A new generation of graduates from these schools and the other architectural programs that rapidly followed suit made Modernism the norm of professional design in buildings and the interiors they housed. The term “interior decoration” fell into disrepute as interior design came to be understood as having roots in functional architectural thought. The Museum of Modern Art in New York became a strong influence through its many exhibitions and publications presenting Modernism in architecture and in all phases of design.

A somewhat less rigorous form of Modernism was introduced into America with the formation of Cranbrook Academy in Bloomfield Hills, Michigan (near Detroit) with the Finnish architect Eliel Saarinen as its director. The buildings of the Academy and their interiors demonstrated Modernism that accepted natural and warm materials and craft-related design in textiles and other accessory elements. A number of influential designers were students and instructors at Cranbrook who went on to have a significant role in design in America. Among them was Eliel Saarinen’s son Eero (1910–61), an architect whose work always showed major concern for the character of interior spaces, as in the extraordinary interiors of the TWA terminal at New York’s Kennedy airport of 1956–62, with its flowing, sculpturally formed spaces.

A competition organized by the Museum of Modern Art in 1940 had as its winners Eero Saarinen and Charles Eames (1907–78) who together developed concepts for modern furniture intended for low-cost industrial manufacture. Although the winning designs never entered production, each man went on to develop a number of furniture designs that had wide acceptance for use in modern interiors. Eames’s designs in moulded plywood and in plastic became “classics” of modern furniture and major elements in the success of the Herman Miller Furniture company of Zeeland, Michigan. Saarinen’s designs were taken up by the firm of Knoll International and played a comparable role in the success of that company. Knoll established a “planning group”, in fact an interior design service under the direction of Florence Knoll (b.1917), a member of the Cranbrook-based group that included Eames and Saarinen. Her interior and furniture design further solidified the modern stylistic direction that became typical of the post-World War II era in America. Other Cranbrook-trained designers included Harry Bertoia (1915–78), a sculptor whose furniture designs were also introduced by Knoll.

Many large firms entered the interior design field, some with departments within even larger architectural offices such

as that of Skidmore, Owings and Merrill (often known as SOM). Some like ISD (for Interior Space Design) specialized in interior projects such as offices for major corporations and other institutional and commercial projects. Other designers worked as individuals or with smaller organizations sharing the conceptual ideas of the Modern Movement in somewhat varying personal styles. In 1946 George Nelson (1908–86) introduced an extensive line of modern furniture that became an important part of the Herman Miller product line including seating, modular storage units and, eventually, office systems. Alexander Girard (1907–93) carried on an interior design practice, but also contributed a flow of textile designs for Herman Miller.

In contrast to the directions of functionalist Modernism, many interior decorators continued successful practices devoted to residential interiors. Mrs. Henry Parish II (1910–94), known as “Sister Parish”, William Pahlmann (b.1900), William “Billy” Baldwin (1903–83) continued to produce florid, eclectic interiors in which more or less traditional forms were used with exaggeration, strong color and a sense of excess that had an appeal to many wealthy clients. Another group of decorator-designers adopted a somewhat more restrained vocabulary, accepting the ideas of Modernism to some degree, but blending modern ideas with efforts to adjust to the more conservative tastes of many of their clients. Among this group may be included T. H. Robsjohn-Gibbins (1905–76) who was born and trained in England but made a career in the United States beginning in 1936, Edward Wormley (b.1907), who was best known for his furniture design for the Dunbar Furniture Company of Berne, Indiana, Benjamin Baldwin who had a role in establishing the interior design department of SOM before starting his own practice, and Ward Bennett (b.1917) whose work came close to the purist Modernist direction often called “minimalism” for its extreme simplicity and restraint.

A number of design firms appeared in the post-war era that specialized in a particular area of practice. Office planning or, as often called, “space planning” developed as a specialty of such firms as ISD, Space Design Group and Designs for Business, organizations that employed a large staff, expert at planning large corporate office installations, supervising their construction and providing full decorating services. Awareness of the German concept of *Bürolandschaft* (office landscape) surfaced in America in the 1960s and instigated a conflict between design firms that accepted the concept of the “open office” with minimal partitioning and the more conservative firms that continued to plan offices as groupings of partitioned rooms. A variety of furniture systems were developed to relate well to open office planning. One of the first such systems to achieve popularity was the Action Office, developed by Robert Propst for Herman Miller in several successive steps in the 1960s and still in production in somewhat extended form. Other manufacturers soon introduced comparable systems, all characterized by screens or panels connected with furniture so as to make partition walls unnecessary. By the 1980s, the competition between “open” and “conventional” office planning had been resolved largely through acceptance of a blend of the two approaches, using furniture systems that offered the range of possibilities from fully open to totally partitioned office spaces.

USA: dining room by Gilbert Rohde

In residential interiors, the 1980s brought a variety of approaches including, among others, an upsurge in lavish, costly and often ornate interiors for the homes of the wealthy. Among the well known and highly successful practitioners in this group are Mark Hampton and Mario Buatta. The work of John Saladino strikes a balance between the lavish extremes of the era and a more restrained decorative approach. Architectural design continues to exert a strong influence on interior work through the work of many architects and through the influence that architectural directions exert on interior design practice. Critics and historians of recent architectural development have come to recognize several distinct approaches that have come to exist in parallel, often in competition with one another.

The term "Postmodernism", that would seem to refer to any work succeeding the Modernism of the 1920s to the 1950s, has come to identify a particular direction in which the Modernist emphasis on order and logic has given way to an openness to the pluralism favored in *Complexity and Contradiction in Architecture*, the 1966 manifesto by Robert Venturi (b.1925) published by the Museum of Modern Art. Although Venturi did not announce a Postmodernist movement, his challenge to the doctrines of Modernism and his

inclusiveness (including acceptance of reference to past historical styles) made his theoretical position an important basis for the Postmodern work that followed. Venturi's own interior work, such as his showroom for Knoll (1979) in New York, with its exaggeratedly massive mushroom-shaped columns and its conference room ceiling which quoted the Adam style, made it an available example of the direction he favored. His furniture for Knoll, including simple plywood chairs cut out in whimsical forms suggestive of period styles, are also demonstrations of Postmodern intention. Such interior spaces as those of the Seattle Art Museum (1986–92), with its monumental stairway, represent more recent Venturi projects.

The architect Michael Graves (b.1934) became known for several furniture showroom interiors that make use of pastel colors and strong but arbitrary forms that break away from the simplicity and austerity of Modernism. In furniture design and in the design of textiles and small decorative objects, Graves has had a further opportunity to demonstrate his personal style. In his major architectural projects such as the Clos Pegase winery in Napa Valley, California (1983), a variety of Postmodern interiors are integral to the buildings. The architecture of Robert A.M. Stern (b.1939) has moved gradually closer to straightforward historical imitation in the manner of

USA: designs by Frank Gehry for Knoll Furniture

the eclecticism of the 1920s and 1930s with interiors that move in a similar direction.

The term High-Tech has come to be applied to work that is based on the technology of modern building, giving emphasis to structure and the elements of mechanical systems such as air-conditioning ducts, plumbing pipes and lighting equipment. The High-Tech interior exposes and emphasizes ducts and piping and selects materials and forms, metallic surfaces and sharp edges, suggestive of mechanical origins. The work of the New York partnership of Hardy Holzman Pfeiffer, such as a health-care facility in Columbus, Indiana illustrates this direction. Interiors by Joseph Paul D'Urso (b.1943) make less aggressive use of mechanical elements, but can be related to the High-Tech direction through the use of mechanistic materials and surfaces and the incorporation of clearly industrially produced elements in furniture and equipment.

Belief that Modernism is by no means dead is supported by the work of a number of architects and designers who have not been persuaded either by the doctrines of Postmodernism or by the mechanistic emphasis of High-Tech. In seeking to describe this ongoing approach, some critics and historians have taken up the term "late modern" to identify work that is the continuing expression of the basic ideas of Modernism. The work of the architect I.M. Pei (b.1917) includes interiors having the dignity and simplicity associated with Modernism such as those of the East Building of the National Gallery of Art in Washington, DC (1971–78), the 1968 addition to the Des Moines Art Center and the Cleo Rogers Memorial Library (1966–71). The work of Richard Meier (b.1934) and of the firm Gwathmey Siegel and Associates shows a comparable loyalty to the concepts of Modernism. A number of houses by Meier make use of complex geometric forms, but the simple white surfaces and restrained forms of furniture make the use

of the term "late modern" appropriate. Charles Gwathmey (b.1938), originally a member of a New York-based group of five architects who became known as "the whites" (in reference to their almost unvarying color preference), has continued to produce work in his present partnership with Robert Siegel that often suggests a loyalty to the work of Le Corbusier with the use of such elements as tubular columns and areas of glass block.

A 1988 exhibition of architectural work at the Museum of Modern Art was titled "Deconstructivism", bringing this term into use to describe another emergent direction in architecture and the associated interiors. The use of elements that seem torn apart and reassembled in loose and irregular patterns characterizes Deconstructivist work. Although there is no identifiable "school" of Deconstructivists, the appearance of broken, torn and jagged forms in much recent practice internationally suggests that this is a direction taking on increasing life. American work of this kind includes projects by Frank Gehry (b.1929), such as the additions to his own home in Santa Monica, California (1979–87) or the spaces of the Weisman Art Museum in Minneapolis (1994). Gehry's influence in interior spaces is broadened by his designs for furniture and other objects such as lamps. The 1972 chairs of corrugated cardboard named *Wiggle* and *Easy Edges*, the fish lamp of 1983 and the extensive line of furniture made up from strips of moulded plywood (for Knoll, 1989–91) make Gehry design available to other designers. The work of Peter Eisenman (b.1932) has moved from an early involvement with basic geometry toward broken and irregular forms, as in the interiors designed to house the exhibition *Cities of Artificial Excavation* at the Canadian Centre for Architecture in Montreal in 1994. Among a number of recent projects by Michael Rotondi, Nicola, a Los Angeles restaurant of 1994,

uses complex overlapping and broken forms to convert space within a typical modern high-rise into deconstructed, angular activity.

An increasing interest in historic preservation has led to a developing practice in the restoration of structures that have fallen into decay and in “adaptive reuse”, that is, invention of new functions for older buildings worthy of preservation. The Frank Furness Academy of Fine Arts in Philadelphia (1876) and the New York Public Library (1898–1911) are examples of older buildings whose interiors had become shabby and neglected. In each, careful restoration of interiors has generated spectacular spaces fully functional in their original roles. Union Station in Washington, DC (1908), serving only minor functions as a railway station, has been brought into a new life through interior renovation that makes it serviceable as a shopping center, while preserving its dramatic and monumental interior spaces. The development of proposals for aesthetically valid and economically practical uses for older buildings no longer useful in their original roles has become a significant part of current interior design practice.

Upholsterer, history and role of

Although references to “upholders” can be found as far back as 1258, and they were recognised as a separate “mystery” in 1360, the nature of their trade at that time bore little relationship to what is now recognised as upholstery work. However, they gradually achieved a degree of respectability when in 1465 the Upholders were granted a coat of arms. In 1474 a petition was presented by the Mystery of Upholders which indicated that their wares already included feather beds, pillows, mattresses, cushions and quilts. This petition demanded more control over scurrilous makers who filled mattresses with “cats tails and thistle down” and thereby brought the upholders into disrepute. This appeared to be a recurring problem, as in 1495, and again in 1552, Acts were passed forbidding the use of stuffings other than feathers or down. These measures began to control some of the apparent excesses, as in 1626 the Upholders Company was granted a Royal Charter indicating a recognition of their changed circumstances.

Originally they were dealers in old clothes, old beds, old armour and other diverse sorts of materials. The upholsterers’ shabby and unsavoury image took some time to shake off. In Stow’s *Survey of London* (1598), he observed that Birchin Lane in the City of London “had for the most part dwelling Fripperers or Upholders that sold olde apparel and household stuffe”. Their reputation, at times being accused of handling stolen property, and selling contrary to the established customs of the City of London, remained suspect into the 17th century.

The fitting up of domestic textiles in large households was originally carried out by the *tapissier* and the *fourrier*. Their work included the supply of canopies, wall tapestries, table

Upholsterer from Diderot's *Encyclopédie*, c.1770

carpets and other soft furnishings for interior decoration. It was these posts that were to be subsumed by the upholsterer during the 17th century. As wealthy clients were beginning to require interiors that were consciously co-ordinated, it was the upholsterer who began to play a pivotal role in house furnishing supply. This role was to eventually develop into the profession of interior decorator. Upholsterers were becoming arbiters of taste, not only through access to important homes and the circles of the wealthy, but also through their skills in introducing new styles and tastes. Several 17th-century upholsterers became wealthy and had a certain prominence in society.

After the Restoration, Robert Morris was appointed the King's Upholsterer and he supplied carpets, chairs, couches and bedsteads. However it was the important influence of France that is most noticeable at this time. In the Lord Chamberlain's accounts, John Casbert is recorded as an upholsterer supplying furniture, canopies and royal yacht decorations, while other listed names, such as John Poitevin, Francis Lapierre, and Philip Guibert, testify to the French connections. Indeed there were even examples of imported Parisian upholstery work to be found in England.

These instances begin to demonstrate that the role of the upholsterer was more of an orchestrator and co-ordinator than

simply a tradesman. Although the upholsterer could operate successfully only with the assistance of the silk mercer, the *pasementier*, the embroiderer, the cabinet-makers, and a whole range of other sub-contractors including feather dressers, linen drapers, glass merchants, blacksmiths, carvers, gilders, and the whole spectrum of building crafts, it was the upholsterer who was responsible for the works and who often took a profit on their contribution. Indeed it was noted at the time that the upholstery business was potentially a very profitable living.

Although architects began to exercise influence over interiors during the 18th century, by that time the upholsterer had already established himself as the master of integrated room schemes and decorations. This occasionally caused friction. Sir William Chambers was put out by Thomas Chippendale showing him designs for furnishing rooms for his patron. The architect requested his client to consult him as he considered himself "a very pretty connoisseur in furniture". By the mid 18th century the upholsterer's specialty as an arbiter of taste was recognised by contemporary commentators, and this established a particular relationship between retailer and customers that has remained to this day. Robert Campbell, in the *London Tradesman* (1747), was happy to say about the upholsterer that: "He is that man on whose judgement I rely on the choice of goods; and I suppose he has not only judgement in the materials but taste in the fashions, and skill in the workmanship". Campbell continues by describing the upholsterer, whose

genius must be universal in every branch of furniture: though his proper craft is to fit up beds, window curtains, hangings and to cover chairs that have stuffed bottoms. He was originally a species of the Taylor, but by degrees has crept over his head, and set up as a connoisseur in every article that belongs to a house ...

An example of the actual duties of an employee of an upholstery firm, in this case the business of Thomas Chippendale, is indicative of the work that was carried out. The upholsterer stayed at the client's house, often for months at a time. During this visit he received and unpacked the furniture and furnishings, "hung walls with damask or paper, made up bed furniture, upholstered the covered seat furniture, laid carpets and put up blinds (including those called Venetian), and made covers for every possible article, petty-cotes for the toilet tables, leather cases to encase the posts of the family bed, and oil-cloths for the sideboard tops".

The co-ordinating role of the upholsterer as a full house furnisher was always important, but the specialist emphasis on material and draperies never went away. These were usually associated with the conversion of textiles into finished "upholstered goods". This role in the decorating process involved them in making and fitting beds, curtains, hangings, and making stuffed chairs with tight and loose covers. Indeed the "proper craft" of upholstery itself demonstrated some subdivision. For example, the actual cutting out of expensive materials was seemingly left to male workers, while cheaper female labour was usually employed for all the sewing as they "never served an apprenticeship to the Mystery". There is evidence that chair-stuffing became a separate skill, while the chair-frame maker had been a distinct trade for a long

time. There were of course upholsterers who did not rise to the full decorator status and it was to these that Campbell was referring when he described "the young man who has a mind only to be a mere upholder and has no prospect of setting up in the undertaking way". He must handle the needle so alertly as to sew a plain seam, and sew on the lace without puckers, and he must use his sheers so dextrously as to cut a valance or counterpane with a gentle sweep according to a pattern he has before him". This reference clearly refers to operative upholsterers.

In addition to the wide-ranging upholstery tasks, the upholsterer also became involved in funeral and mourning decorations. The supply and fitting of black cloths throughout the house, as well as the supply of coffins and other paraphernalia associated with the funereal rituals, kept upholsterers busy. The connection between death and appraisal is obvious in the preparation of inventories, but descriptions of this aspect of their trade seem to indicate that upholsterers were also adjudicators in conflicts between parties. Campbell suggested that they always valued things at a low price as "they are obliged to take the goods if it is insisted on, at their own appraisalment". Upholsterers sometimes also added the title "Brokers of old goods" to their trade cards, an aphorism for second-hand dealers, no doubt resulting from their work as appraisers.

The importance of the upholsterer in the Regency period is testified to by the growth in numbers of practising tradesmen listed in trade directories, as well as an increasing number of pattern and design books especially aimed at this particular business. These works included George Smith's *Household Furniture* (1808), Ackermann's *Repository of Arts* (1809–28), John Taylor's *The Upholster's and Cabinet Maker's Pocket Assistant* (1825), and Thomas King's *The Upholster's Sketch Book*. Equally important was the publication in 1834 of Crofton's *London Upholsterer's Companion* which was a comprehensive account of the processes of upholstery, including the newly revived interior springing. The publication of this trade manual, which consolidated contemporary knowledge of upholstery techniques, demonstrates the growth of the business of upholstery. Not long afterwards, *The Workwoman's Guide* (1840) was published, perhaps giving an indication of the role played by women in the practical sewing and making-up of upholsterers' requirements.

In the 19th century the role of the upholsterer began to change. One path was for successful entrepreneurs who had developed upholstery businesses into comprehensive furnishing firms to continue to dominate the better class of trade. The other path was for the working upholsterers to remain as skilled craftsmen who were employed in the workshops of the larger enterprises. For the high-quality trade, the workers remained an all-round craftsmen for much of the century. Indeed it would be unjust to claim that upholsterers' skills deteriorated during this time, for some of the products of the 19th century were amazing in their proficiency and imagination in the cause of comfort and taste. At other levels, attempts were introduced further to divide the labour of upholstery workers. However, with the introduction of spring seats a new skill had to be learned. Initially this was a jealously guarded secret, held by immigrant upholsterers, but in a short space of time the new methods were common knowledge, and the basis of much upholstery and re-upholstery work. The descriptions

of the trade in the mid-19th century confirm the continuing role of the upholsterer. Henry Mayhew writing in 1850 commented: "The upholsterers who confine themselves to their own proper branch, are the fitters up of curtains and their hangings, either for beds or windows; they are also the stuffers of chair and sofa cushions and the makers of carpets and of beds; that is to say they are the tradesmen who in the language of the craft 'do the soft work' or in other words, all connected with the cabinet makers art in which woven fabrics are the staple". As well as this soft work, many upholsterers were still involved with funeral directing and the appraising business.

The publication of practical manuals on upholstery techniques from the 1870s onward indicate the decline of the apprenticeship system and the rise of a new breed of upholsterer. One such book was published in 1876, revised in 1912, and reprinted five times up to 1949. In addition to this change, the growth of department stores that separated the various components of the upholsterers' work into departments dealing separately with cabinet-making and furniture, soft furnishings, upholstery and the supply and fitting of carpets meant further division of labour and loss of prestige.

In the United States during the 19th century, the upholsterers craft was much diminished by a series of developments which reduced the skill levels required to make upholstered work. The introduction of prefabricated spring units, buttoning machines, and electric sewing machines meant that the bulk of the craft skills disappeared.

Indeed in the 20th century the role of the factory upholsterer has diminished further with continual developments in pre-fabrication of seats, cushions and other elements of upholstery, which, combined with the staple gun, have meant that upholstered furniture can be produced with semi-skilled labour. However, there remains a place for skilled craftsmen who are able to work with traditional methods and materials. The demand for traditional quality new work, as well as demand from heritage organisations and other customers for re-upholstery will ensure the future of the craft.

Upholstery

All upholstery consists of four basic elements: the frame, the supporting system, the padding or cushioning, and the outer cover. Although textiles and various fillings had been used to make cushions and squabs since the Middle Ages, it was not until the 16th century that anything like true upholstered furniture was made, as the peripatetic nature of life among the upper classes was not conducive to fixed furnishings. When they had established a more static way of life, the demand for comfort grew rapidly and a range of upholstered articles began to meet their needs. Chairs backs and seats were covered with fabric and some examples had the whole frame covered with cloth.

By the beginning of the 17th century, variants of a simple upholstered back stool (or farthingale chair) were known in many European countries. By the end of the century all the upholstery techniques (with the exception of springing and certain stitching methods) were known and used. While the techniques of upholstery at this time were elementary, the effects were often sumptuous due to the rich textiles employed. The simple chairs developed longer and taller upholstered backs and set standards that survived well into the 18th century. The more comfortable easy chair that developed in the 18th century seems to have derived from invalid or sleeping chair models. These especially comfortable chairs had large down-filled cushions and padded backs filled with horsehair. Most forms of upholstered chair were finished with decorative trimming, piping or nailing.

The early techniques of upholstering were simple but workmanlike. Webbing, canvas and a variety of stuffing materials were employed to make up the seat or back. By the Restoration (1660), most fashionable families were employing upholsterers to supply comfortable seating and other furnishings often decorated with elaborate trimmings.

During the mid-18th century the upholstery procedures followed a similar pattern. Webbing was stretched to form an interlaced support over which was fixed hessian. Curled hair was laid onto this, and stitched through to the webbing to prevent excessive movement. A roll edge was made by fixing a tube of stuffing material to the front rail to maintain the shape at this wear point. A layer of linen was fixed over the hair, and then the final top covering was close fitted. In these systems the filling quality was all important. Hay, wool, and hair were

common, but there were also various attempts to develop alternative fillings. The ideas ranged from feather cushions to pigs' bladders filled with air.

Tufting, a technical development, which was originally meant to stabilise the fillings, soon turned into a design feature. This technique, introduced in England and America in the mid-18th century, suited the flatter, squarer design of their chairs rather than the more fashionable domed squab seats favoured in France. Loose seats and backs were also introduced because the often elaborate mouldings made it impossible to fix covers tightly. In addition, it meant that seats could be re-upholstered or removable covers could be used for the various seasons.

Springs, originating in the requirements for carriage suspension, found their first use in chamber or exercising horses. Some accounts propose that a German blacksmith was responsible for the invention of the coil spring, while there are various references to their use in 18th-century France. In 19th-century England the acceptance of upholstery springs seems to have grown rapidly. In 1826 Samuel Pratt took out a patent for improvements to springs. Pratt's patent defined the spring unit in such a way as to indicate that it had advantages that would be its selling points for many years. These included the sprung edge, reversibility, and the fact that the springs could be built either into furniture or fitted to a removable cushion.

The earliest attempts at securing springs were to solid boards as used in 18th-century chamber horses, with the result that they did not have the same degree of resilience that came with the later use of webbing. Some 19th-century American sofas exist with iron coil-springs stapled directly to board or slatted bottoms in this manner. The resultant upholstery work was inevitably heavier and less resilient than the conventional methods of using webbing, but it enabled spring upholstery to become available to a lower level of the market.

Apart from spiral springs, other endeavours were made to provide an "elastic base" for upholstered chairs. In 1841 John Wilkie, an upholsterer, and Charles Schiewso, a musical instrument maker, patented an early form of tension spring which used the principle of expansion and contraction of small springs mounted on straps. This was an important development, as it avoided the need to have a deep seat to accommodate the original hourglass-shaped springing.

Whatever patents or processes were devised to simplify the methods of spring stuffing, the problem for chair manufacturers still remained: that the full upholstering of an easy chair or sofa was a skilled trade that successfully resisted mechanisation for a long time. The most difficult parts consisted of the tying of the spring bed and the processes of even stuffing and tufting. Techniques were invented, however, to assist in the making of upholstered chairs. The first was simplifying the setting of springs in the interior seat. A simple solution to the seat springing problem was to make a spring unit which had only to be inserted into the frame. The sewing of covers was aided by the use of the industrial sewing-machine, but otherwise it seemed that the mechanical assistance that became available in other parts of furniture-making was not possible with upholstery. However, as buttoned or tufted upholstery was a major feature of the period it is not surprising that attempts were made to try to simplify the process by mechanised means. But not until the end of the century was a satisfactory method marketed. The tufting machine produced a

“blanket” of backing, stuffing and material top-cover together which could then be applied to a sprung frame with much more speed and ease than the traditional built-up process. Naturally this encouraged the division of labour and a consequent reduction in the skill required for upholstering chairs and sofas. There was also an attempt to mechanise other parts of the upholstery process. In 1878 it was reported that a Paul Roth of New York was exhibiting machinery that would produce a stitched edge, pack the hair into a seat and tie the springs.

Whatever the merits of these machines they were not exploited commercially, and it is fair to say that the upholstery trade remained generally unaffected by changes in technology until the introduction of man-made fillings, and staple guns in the 20th century. The production of a fully upholstered chair was based on the craftsman constructing the shape onto a pre-formed wood, or sometimes iron frame. This called for considerable skill in technique, as each chair had to be built up in carefully balanced layers. The main change in the process was the gradual division of labour into the three stages of stuffing, cutting out of covers and covering. However, as chairs were usually made to order in a wide variety of fabrics, the integration of the upholstery business into the factory situation was a slow process that still remained based on workshop practice well into the 20th century.

It is clear that the internal spring revolutionised upholstery practice and design in the 19th century. This is an obvious case of a technical improvement that affected the look of an object. Where seats were upholstered with a base of webbing and a simple mixture of fibres as padding, the depth of the seat did not need to be very great. Spring seated upholstery designs usually needed to take account of the depth required for the construction of the padding and spring system and also to take account of the increased tension on the frames. As soon as springs were introduced, a completely different profile had to be used to accommodate the rise and fall of the spring. The main result of this was the fully upholstered chair. This style of chair built up on a sprung base with layers of filling, an intermediate cover and a top covering material, has become a hallmark of Victorian furnishings. The main design feature that occurred as a result of the new method of stuffing was the buttoned seat and back which gave a particularly plump look to easy chairs of the time.

During the 20th century, the nature of all of these elements has changed in varying degrees. Perhaps the most significant change has been the gradual use of ready-made parts such as spring units, needled and layered fillings on paper backings, foam and polyether cushioning all cut to size, as well as ready-made frame sections, and the pneumatic staple gun, all of which meant that the skills of an upholsterer changed.

20th-century developments in upholstery were to change the internal structure of frames and to bring about the use of new materials to substitute for traditional ones. The traditional method of upholstery-frame making often relied on the separate craft of frame-makers. These craftsmen built wooden frames to a specification and then delivered them to upholstery workshops. These were usually a framework for the suspensions and coverings, and in many cases were completely hidden after upholstering. At various times fashion has created “show-wood” upholstery, which called for exposure of the frame.

This varied from a hint, such as an arm knuckle, to a fully polished show-wood frame with loose seat and back cushions, which called for considerable frame-making skills. In addition to wooden frames, the revival of the 19th century idea of metal frames was used both for internal and external frames.

The technical changes in upholstery have been related to both the internal structure and the external coverings. At the beginning of the century the spiral spring was supreme, but in the 1930s tension springs were introduced into Germany and England. This released the designer from having to create a deep section to a chair to accommodate the spiral springs: he could produce a more elegant easy chair while retaining the benefits of metal springing. In 1929 the development of latex-rubber cushioning was patented by Dunlop. When made up into cushions, this became an ideal partner to the tension-sprung chair. Post-war developments included four-point suspension (one-piece rubber platform) and the introduction of rubber webbing by Pirelli. Both these processes hastened the demise of the traditional spring, until the introduction of serpentine metal springs, which enabled manufacturers to produce a traditional-looking upholstery range without the cost of a fully sprung interior. Metals were also utilised by designers like Ernest Race, who created new lightweight organic shaped chair and sofa frames from metal rod.

In the late 1940s the hammock principle, used in upholstery based on aircraft seating and using rubberised hair filling, was patented by Christie Tyler. This suggestion was again taken up in the 1960s and early 1970s, when there was a fashion for chairs made from chromed tubular steel fitted with hammock cushions. With advances in technology and design strategies during the 1960s, chairs were produced which incorporated frame, structure, and padding in one item. The plastics revolution that allowed this was responsible for an incredible range of extremely varied objects which included: the *Sacco* chair filled with high resistance foamed polystyrene balls; the *Blow* chair in inflatable PVC; the *Pratone* of integral foamed polyurethane foam; or even the *Up* chair designed by Joe Colombo, which was made from polyurethane foam, vacuum packed in a box which “came to life” in your living room as it was unpacked. In the contract market, plastics became a valuable material for seating work.

Plastics also earned a place in post-war upholstery with the introduction of polyether and polyester foams for cushions and padding. Developments continued with substitutes for most traditional materials, for instance, man-made fibrefill in place of cotton-fibre wrap. The constructional use of plastics in chairs has been mentioned, but the development of polystyrene shells to create an extremely lightweight frame should be noted. External coverings have been revolutionised by the use of PVC-coated fabrics which were themselves a substitute for the earlier leathercloths.

Although upholstery design for the consumer market has remained stubbornly traditional, a variety of innovations have been introduced in the manufacturing processes. These include frames made from particle board or plywood, pre-formed plastic arm, wing and leg sections, and even complete plastic frames for “Queen Anne” chairs.

Contemporary upholstery work has ranged from the practical to the highly experimental. The exploitation of materials such as stretch fabrics to create sculptural shapes, the imagina-

tive use of foams to create fantasy furniture and the re-introduction of traditional products such as wicker, cane and grass point to interesting developments in the future.

Utility Design 1941-1951

The Utility Scheme, which first came into effect with clothing, was introduced into Britain in the early 1940s. When World War II broke out in September 1939 many goods imported into Britain were quickly in limited supply due to the acute shortage of commercial shipping. Imported foodstuffs were rationed; every rationed commodity was given a "points" value and every family was allocated so many points per week. The points system was put to very similar use in the scheme to ration clothing and furniture.

On 1 June 1941, the British government introduced clothes rationing. Three main considerations informed this move: first, the need to control consumer spending in order to control the war-time economy; second, to re-align the clothing industry and release employees for more important war work; and third, to free up more factory space for the same end. Although organised along roughly the same lines as the points system food ration, clothing regulations depended upon the use of coupons. Each garment was given a certain number of coupons depending on material and labour costs; a woman's coat required 14 coupons for example, while a blouse needed only 5, a total of 60 coupons was allowed in 1941. The following year, the Civilian Clothing Order introduced Utility clothes.

The Utility Scheme was primarily the work of the President of the Board of Trade, Hugh Dalton. Having taken up the post in February 1942, it was he who gave Utility the unstinting backing it needed to succeed. Under Dalton's leadership, the Board of Trade asked every member of the Incorporated Society of London Fashion Designers to submit four basic outfits. The most suitable were then selected, mass-produced and appeared in the shops in 1943. All garments had to be

made from Utility fabrics and carry the "CC41" label; "CC" stood for Civilian Clothing and "41" for the year in which the mark was patented. It was not until February 1949 that coupon-free clothes would appear.

Although domestic pottery and crockery were not rationed, and not strictly speaking Utility pieces, these items too were produced with some degree of Government intervention. From 1 June 1942, the prices of domestic pottery were controlled. By April of the following year, the Board of Trade had prohibited the manufacture of all decorated and "unessential" items. Glazed but undecorated natural clay colours, white, brown and cream were now all that were allowed to be used. From the autumn of 1942 Wedgwood turned the whole of its factory output over to the manufacture of Utility items and became a key centre in the production of Utility ware. Wedgwood's Victory Ware, designed by the company's Art Director, allowed for the production of neat, simple, easily stackable items. All in white earthenware, the range comprised a plate, in three sizes; a meat-dish in two sizes; a soup dish; dual purpose bowl; cup and saucer; a beaker; a sugar or jam bowl; a jug, in three sizes; a teapot in two sizes; an egg-cup and sauce-boat. Commenting in 1942, the Design and Industries Association said of Victory Ware, "Good design – or the lack of it – has never been so apparent as it is under the new restrictions, and Wedgwood have come unscathed through the Utility acid test" (Geffrye Museum, 1974).

Of all the aspects of the Utility Scheme, furniture production was the most rigorously supervised. When Britain entered the war in 1939, timber was already in short supply. It was decided that the only way to get furniture to those who really needed it – "Bombees" – was, again, to ration it. In 1942 the Government set up an Advisory Committee headed by the designer Gordon Russell to advise on the designs for furniture. Russell had already been involved in the production of dignified furniture at low cost in his own company, Gordon Russell Ltd., and similar impulses inspired the Utility scheme. The Committee's brief provides a neat summary of the venture's aims: "to produce furniture of sound construction, in simple but agreeable designs for sale at reasonable prices, ensuring the maximum economy of raw materials and labour".

Designs by Edwin Clinch and Herbert Cutler were selected by the Committee and went into production at the end of 1942. This, the initial range of Utility Furniture, was to remain all that it was legally possible to produce for the remainder of the war, and even post-war changes in the design of the available items did not dramatically alter their appearance.

Throughout, Utility products in general, and Utility furniture in particular, retained a pared down functional simplicity and effected an aesthetic compromise between Modernism and traditional English design. Principles loosely derived from the Arts and Crafts Movement were transferred to mass production. The clean, straight lines, functional forms and immaculate finish of Modernism was worked alongside the use of oak and an attention to detail redolent of the best of English cabinet-making.

One of the most striking elements of the scheme is the fact that it represented an unparalleled example of total state control over something which directly affected many peoples' daily lives. A less well known feature of the Utility Furniture programme is the desire to influence public taste. "Here at last

Utility furniture for a living/dining room, 1942

is the chance to teach the public now growing up. To make them more critical of what is good design, what is bad and why, and so stimulate a demand for much better things" (Dover, 1991). It was therefore hoped that the example set by Utility would shape a whole new interior aesthetic, although a conscious attempt was made to moderate the tone of the scheme's corrective ideology lest the public shy away from its products. Official exhibitions favoured the "folksy" touch, with simple gingham check curtains and plain white walls to complement the simple, pared-down furnishings. And it is likely that a neat, light, somewhat sparse yet style conscious interior of the type proposed at the post-war Britain Can Make It (1946) and Festival of Britain (1951) displays was what was intended.

There is some debate about whether or not Utility Furniture achieved the ends set for it by Gordon Russell and his team. The evidence suggests that while many people recognised the need for such a scheme and acknowledged its undoubted quality, it was nevertheless not an aesthetic that they chose to adopt once controls were lifted in 1948. It was unfortunate that the Utility Scheme, despite its high standards, had become associated in the public mind with "making do", sobriety and austerity. Those who did favour a more modern Scandinavian-

influenced interior style following the war were in all likelihood simply reacting against the tastes of the previous generation, something which would probably have happened anyway. In the short term, however, the scheme served its purpose – the provision of good quality, value-for-money, well designed essential goods – remarkably well. Utility furnishings are still acclaimed by those who used them during the 1940s and the fact that so many pieces survive today is testimony to the robustness of their manufacture and design.

V

Vanbrugh, John 1664–1726

British architect

Sir John Vanbrugh was one of a small group of architects whose work was at the forefront of the Baroque style in England, and his buildings include some of the most outstanding and well-known examples of this style as it emerged in the late 17th and early 18th centuries. He came to architecture relatively late in life after a colourful and varied career that included a spell in the army, a period as a successful playwright, a two-year imprisonment in France, and a venture at sea as captain of marines. Receiving his first commission in 1699, he produced astonishingly ambitious plans for a palace for his patron, the 3rd Earl of Carlisle, to be sited northeast of York at Herderskelfe where an earlier castle had been destroyed by fire. Here, as in other projects, Vanbrugh's main concern was with the architectural treatment, and he occupied himself with comparatively little in the way of applied ornament. Nevertheless, the extent to which he developed the entrance halls of his grandest houses, forming great central spaces, proportioned and modelled to announce beyond all reasonable doubt the importance of their owners, represents an important contribution to interior design.

Several of these interiors comprised collaborations with the architect Nicholas Hawksmoor. Hawksmoor had trained under the benevolent regime of Sir Christopher Wren at the royal Office of Works and he was employed to supply the practical and professional expertise that Vanbrugh himself lacked. The two men worked closely and successfully together for many years and Hawksmoor has now been accepted as responsible for much of the detailed interior work in both Castle Howard and Blenheim Palace. Yet it was Vanbrugh who headed the partnership and dealt with patrons, and the Vanbrugh style is consistently carried through at Audley End (1708), Seaton Delaval (1720–28), and Grimsthorpe Castle (1722–26) without the participation of Hawksmoor.

The sequence of great halls which so assert themselves started with a great flourish at Castle Howard, begun in 1700. The house was entered from the north, a novel experience at the time, and the building drew adverse comment for its probable exposure and inconvenience. Early criticism must have stung Vanbrugh sharply for, in a letter to James Craggs dated October 1713, he refutes the supposed impracticability of the

hilltop site and emphasised the absence of draughts by proclaiming that no candles “wanted to be put into a Lanthorn, not even in the hall, which is as high (tho indeed not so big) as that at Blenheim.”

Corridors in the building to east and west of the entrance axis demonstrate further originality, this time modifying the usual *enfilades* of rooms each opening out of the next and which normally would have had no alternative access. These corridors not only improve convenience but add aesthetic effect, opening distant perspectives as one crosses into the Great Hall itself. Here is the unequivocal statement of grandeur, unsurpassed in impact by any other English house.

This first major work introduced the two tiers of round-headed openings and doorcases which so pleased the architect that it became a hallmark of all such subsequent designs. Where the double storey height continues upwards into the octagonal cupola with its high level windows, he emphasises with giant Composite squared and fluted pilasters the corner piers which support the dome. These are surmounted by friezes carved in relief and capped by wide overhanging cornices. Stone quarried on the estate supplied most of the finished surfaces to the satisfaction of Vanbrugh who chose such ashlar masonry for all his halls and for passages and other staterooms as well. “Plain surfaces and bold effects” with “ornaments rich, but vast and few” (Whistler, 1954) are his favoured ingredients for interior work. In fact Castle Howard contains more elaboration than most of his important buildings, with a strong flavour of 17th-century French influence in the use of the classical order. Among the Castle Howard ornaments are the great fireplace surmounted by an unexpectedly florid chimneypiece and, facing it, another large-scale focal point in the form of a sculpture recess executed in *scagliola* – an early, if not the earliest use of this material in England. Classical busts and statues supplement and to an extent humanise the lower levels, as did the painted dome and its pendentives above by G.A. Pellegrini. The fire of 1940 destroyed the dome and its surroundings but restoration has now taken place and the domed ceiling painting was re-created in 1962–63 by Canadian artist Scott Medd. In spite of his penchant for stone, Vanbrugh was fully prepared to lighten stone staircases by the innovative use of wrought iron balustrading, previously in England only seen at the Queen's House, Greenwich and at Windsor Castle.

The arched openings and arcading which had become a regular part of Vanbrugh's vocabulary seem to derive more

Vanbrugh: main hall, Castle Howard, Yorkshire, 1700-12

from the Baths of Caracalla or Diocletian in Imperial Rome than from any French models, although Vanbrugh himself never visited Italy. His large areas of plain interior surface do not follow the more conventional Baroque models as seen in continental Europe but offer a contrast of latent strength as opposed to expressed energy. In this connection it is interesting to compare Vanbrugh's work with that of the Austrian architect J.B. Fischer von Erlach. The two men met when Fischer was living in London in 1704, and each personified the Baroque stylist as conceived in his own country. In England this was always a wayward movement if compared with the Viennese or other versions, but in spite of the muscular Atlantes figures supporting Fischer's staircases, there is recognisable common ground between these two great architects.

Blenheim Palace (1705–16) followed Castle Howard in the canon of Vanbrugh's masterpieces. Here in a rectangular hall where the double-tiered arches dominate a less important Corinthian order, a magnificent scene by James Thornhill portraying the apotheosis of the Duke of Marlborough crowns a third tier composed of windows alternating with panels of military trophies. Adjacent corridors clad in a plain stone Tuscan order with saucer dome ceilings over each arched bay offer highly satisfactory vistas complementing the splendour of the big rooms. In the Saloon, doorcases are faced in marble with scallop shell crestings from Grinling Gibbons, suitably topped with ducal coronets. The influence of French decoration is once again clear and well-executed murals in grisaille and in polychrome were carried out by Louis Laguerre. Much of the remaining decoration in the house fell to the lot of Hawksmoor as a result of Vanbrugh's lack of real interest in such embellishment.

A far more modest application of Vanbrugh's talent, as well as of his favourite arcading motif, was made at Audley End where he altered the hall with a new stone staircase and screen plus, according to Pevsner, a new strapwork plaster ceiling in his own version of the Jacobean style of the existing house. Seaton Delaval, on an open Northumberland site and now sadly dilapidated, still contains its great hall with double tier of arched niches, some filled with the large statues which lend a sketchy idea of the life once possessed by a strikingly original design. Grimsthorpe Castle presents a welcome contrast of survival and, in spite of the fact that only the remodelling of the north front was actually carried out, the building displays what is often considered to be Vanbrugh's finest room, again designed as an impressive entrance to the house. Its seven-bay length is treated with recessed windows centred on the fine Doric entrance door on the north with, on the south wall opposite, a notably Baroque chimneypiece flanked by sculpture niches at ground-floor level with the upper tier framing a series of seven Kings of England in grisaille and attributed to Thornhill. Across the width of the room, staircases at each end are visible through short double thickness colonnades, terminating as pairs of columns expressed on the outside of the north wall. A modillion cornice and unpainted oval moulded ceiling panel are balanced by echoing patterns of black in the marble floor.

In the same year as the hall at Grimsthorpe was completed, Vanbrugh died suddenly of a quinsy at the age of 62. Flamboyant rather than ostentatious, he lent enormous vigour and distinction to the small group of English Baroque archi-

ects who were soon to be superseded by the more readily accepted classical Burlingtonians.

ELAINE DENBY

Biography

Born in London, the son of a merchant from Haarlem; baptized 24 January 1664; childhood spent in Chester. Married Henrietta Maria Yarbrough, 1719: 2 sons. Worked for William Matthews in the wine trade, London, 1681. Received a commission in the army with the Earl of Huntingdon, 1686; imprisoned in France on suspicion of spying, 1688–93; served as a marine captain, 1695–98; resumed service under the Earl of Huntingdon, 1698. Active as dramatist, with plays performed in London from 1696. First architectural commission, 1700; appointed comptroller of His Majesty's Works, 1702; made Herald Extraordinary, 1703, and Clarenceaux to the King, 1704; Surveyor of gardens and waters, 1715; succeeded Sir Christopher Wren as Surveyor at Greenwich, 1716. Knighted, 1714. Died at Whitehall, London, 26 March 1726.

Selected Works

Large collections of Vanbrugh's drawings and papers are in the British Library and in the Victoria and Albert Museum, London, and at Elton Hall, Huntingdonshire. An additional substantial collection of his papers is held by the Borthwick Institute of Historical Research, York.

Interiors

- 1700–12 Castle Howard, Yorkshire (building and parts of the interior)
- 1701 Vanbrugh House, Whitehall, London (building and interiors)
- 1704–05 Queen's Theatre, Haymarket, London (building and interiors)
- 1705–16 Blenheim Palace, Oxfordshire (building and parts of the interior; completed by the Duchess of Marlborough and Nicholas Hawksmoor, 1722–25)
- 1707–10 Kimbolton Castle, Huntingdon (remodelling)
- 1708 Audley End, Essex (hall staircase and screen)
- 1710–17 King's Weston, Avon (building)
- 1716–17 Great Kitchen, St. James's Palace, London (building and interiors)
- 1717 Vanbrugh Castle, Greenwich (building)
- 1718–26 Eastbury, Dorset (building and parts of the interior)
- 1720–28 Seaton Delaval, Northumberland (building and parts of the interior)
- 1722–26 Grimsthorpe Castle, Lincolnshire (remodelling of the north front and interiors)

Vasari, Giorgio 1511–1574

Italian painter, architect, designer and biographer

Giorgio Vasari was undoubtedly one of the most versatile personalities of the 16th century. A man of letters, he was the first great Italian art historian, famed for his *Lives of the Artists*. He was also an architect, decorator and impresario, and although as a painter he was respected more for his diligence than his skill, in his designs for interiors he successfully combined painting with architecture in large-scale works such as the remodelling from 1556 of the Palazzo Vecchio in Florence.

The son of a potter, Vasari was born in Arezzo in 1511, where he learned drawing from a relative, Luca Signorelli. His early promise attracted the attention of Silvio Passerini, Cardinal of Cortona and tutor-governor to the Medici family. In 1524, at the age of 12, Vasari was sent by Passerini to Florence where he continued his humanist education alongside Alessandro and Ippolito de' Medici, beginning his formal art training in 1524 with Andrea del Sarto and Baccio Bandinelli and, for a short time, with Michelangelo. His education was interrupted during the temporary expulsion of the Medici, although he retained his links with the family for the rest of his life, becoming court artist in 1555 to Duke Cosimo I de' Medici whose aim was to gain for Tuscany the prestige enjoyed by major European royal houses.

Returning to Arezzo in 1528, Vasari met Rosso Fiorentino and in 1529 joined Raffaele Brescianino's Florentine workshop where he studied goldsmithing alongside Vittorio Ghiberti. After visiting Pisa and Bologna (where in 1539–40 he produced three large altarpieces and a fresco decoration for the refectory of Camaldolite S. Michele in Bosco) and Arezzo, in early 1532 he moved to Rome where his early paintings acquired a new polish, moving from the post-classical Florentine towards the high *maniera* style (a term supposedly coined by Vasari to describe the work of Michelangelo), that was elegant, self-conscious and fantastic, allying nature with art.

Intending that his own surroundings should be as amenable as those of his patrons, from 1540 to 1548 Vasari set out to decorate his house in Arezzo, incorporating in the Sala delle Arti Mannerist decorative devices and didactic iconography of

painting, architecture, music and sculpture with historical references, from *The Origin of Pittura* and *Apelles and the Cobbler* to the Renaissance. Thirteen portrait medallions grouped chronologically include Giotto, Rosso Fiorentino, and Perino del Vaga, along with the Medici *palle* with ducal coronet. The arms of Vasari and his wife flank a self-portrait bust beside the mantelpiece. Vasari was later to decorate the *salone* of his Florentine house at Borgo S. Croce, no. 8. In the *basamento* small panels decorated with grisaille (grey monochrome) masks are separated by consoles and herms (Grecian-inspired shafts surmounted by sculpted heads).

In 1546 Vasari's first major decorative commission, the grand salon of the Palazzo della Cancelleria in Rome, showed his ability to complement an architectural setting. A fresco records the old and new building of St. Peter's. Also in Rome, from 1570 to 1573 Vasari was to supervise the decoration of three chapels in St. Peter's – S. Michele, S. Pietro Martine and S. Stefano – and in 1573 he completed the Vatican's Sala Regia, commissioned by Cardinal Alessandro Farnese to mark the life of Pope Paul III. Vasari finished the work (with a team of assistants) in just one hundred days, causing the salon to be known as Sala dei Cento Giorni. The extravagant design, after Michelangelo, illustrated the history of Pope Paul III in the Mannerist style – rich, elaborate patterns, contorted movement, and spatial, illusionist devices.

In 1556 Vasari undertook the large scale refurbishing of the architecture and decoration of the state and living quarters in the Palazzo Vecchio in Florence (known also as the Palazza della Signora) on the orders of Cosimo I whose political and artistic aspirations were that this building eclipse the Palazzo Ducale in Venice. In 1556 Vasari began work on the Quartiere degli Elementi (completed in 1559) and Sala di Leone X (1562), linking the two suites of rooms, one above the other, thematically as well as visually. The Quartiere degli Elementi incorporated allegorical references to the gods of Cosmos, a pun on his patron's name, since Vasari was not above resorting to sycophancy. The Sala di Leone X relates to the history of the Medici and their victories, incorporating cross references to the gods in the room above. The Sala dei Cinquecento, a large reception room on the first floor, was painted by Vasari and his assistants (1563–65) with the history of Florence from Ancient Rome to the Renaissance, and the Medici (Cosimo appears in every scene). The ceiling was divided into compartments of varying sizes: "a tasteful, skilful gradation of colouring harmonizes the darker oils with the warmer golds on the blue frameworks of the ceiling, giving the frescoes a light intonation like tapestry" (P. Barocchi, quoted in *The Architecture of the Italian Renaissance*, Peter Murray).

For the marriage in 1565 of Cosimo Medici's eldest son Francesco to Johanna of Austria, Vasari transformed Michelezzo's courtyard at the Palazzo Vecchio in Mannerist style, covering columns with stuccos, gilding and covering the ceiling with grotesque figures and the walls with frescoes of Austrian cities to make the bride feel at home.

In 1570 Vasari designed the Studiolo of Francesco I. Adjacent to the Sala Grande, the small windowless study with its barrel-vaulted ceiling resembled the interior of a jewel chest, lined with cupboards, disguised by paintings, to hold Francesco's collection of small, exquisite treasures and the scientific equipment he needed for pursuing his interest in

alchemy. High *maniera* in style, the studiolo takes as its theme the relation between art and nature, consisting of 34 small panels of differing sizes with eight bronze statues in recesses and two tondo portraits by Bronzino of Francesco's parents, Cosimo I and Eleanora, in semi-circular spaces – lunettes – at either end. Vasari painted only one of the panels, *Perseus and Andromeda*; others were by his team of skilled painters which formed the Accademia del Disegno, such as Cristofano Gherardi, Il Doceno, who in 1546 assisted Vasari with the decorations for the entry to Florence of Charles V.

Vasari's architectural masterpiece, undertaken from 1559, was the building of the Uffizi. "The loggia of the huge building that stretches to the Arno, of all the buildings that I have erected, was the most difficult and the most dangerous, because it had to be constructed over the river and, as it were, in the air," Vasari wrote. The building, was commissioned by Cosimo de' Medici to house 13 administrative offices. The top storey was to house the Medici art collection.

Commissioned by Cosimo I to bring a new beauty and simplicity to Florentine churches, Vasari modernized the interiors of S. Maria Novella (1565–72) and the Gothic basilica S. Croce (1566–84) where Vasari created a tomb for Michelangelo, replacing existing altars in the aisles with uniform large ones and introducing new altar paintings chosen by Vasari's Florentine Academy. Vasari was responsible for six of the 28 altarpieces, executed between 1566 and 1572 in a move away from the high *maniera* style to the more serious spirit of the Counter Reformation. Tall medieval rood screens and monks' choirs were removed from the nave and the choir stalls resited behind a new high altar. In the interests of simplicity the interiors were whitewashed, covering earlier frescoes. This project of religious art, the preoccupation of Vasari's later life, was repeated in other monastic churches.

In 1571 Vasari undertook the painting of the cupola of the Duomo in Florence. His *Last Judgement*, begun in 1572 and discovered during the 1989 cleaning to be part fresco, part tempera, was interrupted by his death in 1574, to be finished by Federico Zuccari.

The patronage of the Medici family which enabled Vasari to undertake his broad humanist education must surely rank as one of the most cost-effective of investments. The Uffizi apart, the industrious Vasari's legacy to art lies not so much in great works of his own but, through his decorations, the embellishment of the work of others and through his writing a better understanding of the role of the Renaissance in emphasizing a new relationship between man and the world.

JACQUELINE GRIFFIN

See also Mannerism

Biography

Born in Arezzo, 30 July 1511, the son of a potter. Studied under Piero Valeriano, and, sponsored by Cardinal Silvio Passerini, alongside Ippolito and Alessandro de' Medici in Florence; trained as an artist in the circle of Andrea del Sarto (1486–1530) and Baccio Bandinelli (1493–1560), 1524–27. He went to Rome in 1532 and 1538, and worked in Pisa, Bologna and Modena; travelled to Venice, 1542. Married Niccolosa Bacci, 1550. Entered the service of Cosimo I de' Medici, becoming his principal painter, architect and interior designer, and managing an enormous army of artists and designers, c.1555; designed and decorated new apartments and council halls for

Medici palaces; also maintained a busy workshop executing commissions for several other patrons. His literary importance lies in his *Lives of the Artists* (1550; revised 1568). Died in Florence, 27 June 1574.

Selected Works

Vasari's most important interior decorations are in the Palazzo Vecchio, Florence, and at the Casa Vasari, Arezzo. A large number of drawings are in Uffizi, Florence.

- 1540–48 Casa Vasari, Arezzo (interior fresco decoration): Giorgio Vasari
- 1551–55 Villa Giulia, Rome (architecture and decoration): Pope Julius III
- 1556 Grotta Grande, Boboli Gardens, Florence: Grand Duke Cosimo I de' Medici
- 1556–74 Palazzo Ducale (Palazzo Vecchio), Florence (Sala dei Cinquecento, Quartiere degli Elementi, Sala di Leone X; Studiolo, fresco and architectural decoration): Grand Duke Cosimo I de' Medici
- 1559–80s Uffizi, Florence (architecture and interior decoration, and Corridor): Grand Duke Cosimo I de' Medici

Publications

Le vite de più eccellenti architetti, pittori, et scultori italiani, 2 vols., Florence, 1550; revised and expanded edition as *Le vite de' più eccellenti pittori, scultori, e architettori* ..., 3 vols., Florence, 1568; edited by Gaetano Milanesi, 9 vols., Florence: Sansoni, 1878–85; 1568 edition translated by Gaston du C. de Vere as *Lives of the Most Eminent Painters, Sculptors, and Architects*, 10 vols., London: Macmillan–Medici Society, 1912–15, reprinted New York: AMS, 1976

Vassé, François-Antoine 1681-1736

French decorative sculptor, bronzier and designer of ornament and furnishings

François-Antoine Vassé was one of the foremost French designers of the late reign of Louis XIV, the Regency (1715-23) and of the early years of Louis XV's reign. Vassé was a rival of his now more familiar and acclaimed contemporary Gilles-Marie Oppenord, and his posthumous reputation has suffered for lack, perhaps, of that concerted effort to reproduce his designs which helped secure Oppenord's fame, and because his career unfolded largely at the heart of the Bâtiments du Roi where he worked collaboratively with other designers and sculptors in the office of the First Architect, Robert de Cotte. One concern of recent scholarship has been to try to establish with greater certainty to whom should be attributed the authorship of the various decorative enterprises executed by the Bâtiments teams, a task made all the more difficult in Vassé's case because he both designed schemes, sometimes executed by others, and executed decorative works not always of his own invention. Nevertheless, Vassé was clearly esteemed by his contemporaries as a designer; his obituary published in the *Mercure de France* in March 1736 made particular mention of the prodigious quantity of drawings by his hand, "in very good taste and in virtually every possible genre." At the same time, Vassé himself evidently rated his talents as a sculptor highly, charging such exorbitant rates for his handiwork that the Bâtiments rarely employed him as an ornamental wood-carver (the likes of Jacques Verberck were cheaper) though it could not dispense with his skills as a bronzier. His supreme achievements were works such as the decoration of the gallery at the Hôtel de Toulouse, the salon at the Château de Petit-Bourg and the Salon d'Hercule at Versailles where he was engaged as both creative mind and skilled hand.

Born in Toulon and a pupil of his father, the sculptor Antoine Vassé, François-Antoine first worked in the shipyards of this famous French port. Early contact with the navy was to have far-reaching consequences; first, because Pierre Puget and Jean I Berain had been providing the Toulon Arsenal with ornamental designs for the decoration of frigates and men-of-war for over half a century, thus bringing the young sculptor to an early appreciation of robust sculptural forms and the vocabulary of the grotesque, and secondly, because after Berain's death in 1715, Vassé was to succeed to the post of Dessinateur Général de la Marine. By that date, however, Vassé had been resident some 17 years in Paris, where he had come to the notice of the Bâtiments du Roi, and rapidly became the

favourite designer and inventor of ornament of Robert de Cotte, thus enjoying a position of influence not unlike that of Pierre Le Pautre in relation to Jules Hardouin-Mansart, a generation earlier. Vassé built his reputation, initially at least, on his contribution to the major ecclesiastical commissions of the day, most notably the decoration of the chapel at Versailles (1708-11) and the internal embellishment of the choir of Notre Dame, begun in 1709 under Louis XIV in propitiation of Louis XIII's vow but only completed some twenty years later. Though Vassé's obituary and some contemporary accounts exaggerated the scope of the sculptor's contribution, the quality of the trophies he executed in the chapel nave and the elegant design and execution of the bronze ornaments for the high altar at Notre Dame cannot have failed to have brought him to the favourable notice of discerning private patrons.

One of Vassé's earliest important patrons was Louis Pardaillan de Gondrin, Duc d'Antin, Directeur des Bâtiments du Roi, who directed Vassé's talents to his personal pleasure in the decoration of both his Paris mansion and his country house, neither of which survive. In 1713 the Duc d'Antin bought a recently finished hôtel at the corner of the rues Neuve-Saint-Augustin and Louis-le-Grand, the first-floor apartment of which he then proceeded to have elaborately decorated during the course of the following year. According to the *Mercure*, Vassé was responsible for the sumptuous and exotic treatment of the Cabinet Chinois which was described by the guide-book writer, Piganiol de La Force, as a room, "dressed in old lacquer panels with chinoiserie paintings of varied forms and embellished with mirrors offering a very seductive *coup d'oeil*." In addition to articulating the distribution of the lacquered panels and six mirrors, Vassé would also have been responsible for designing and carving the gilded mirror frames and the frames of the four oval overdoors (copies by François Stiemart after Annibale Carracci and Domenichino) and the bronze ornament of the chimney-mantle.

A decade later Vassé began work on the decoration of the Grand Salon at the Château de Petit-Bourg, the principal reception room at d'Antin's country house. Though the constituent elements of the decoration itself are lost, three drawings by Vassé in the Tessin-Hårleman collection at the National Gallery in Stockholm allow a full reconstruction of the magnificent ensemble. Paired, fluted Corinthian pilasters mounted on a shared stylobate lent grandeur to the room and effected a pompous rhythm about the walls. On the south and north walls, the pilasters framed chimneypieces surmounted by full-length portraits of Louis XIV and Louis XV. Their elaborate, *chantournés* frames linked wall and ceiling via trumpet-blowing figures of Fame set on either side of central cartouches. The four corners of the room were accentuated by overdoors set into elaborately carved frames, frames which occupied more than their allotted places and overflowed onto the door casements or walls below and broke through the cornice above. The striking espagnolette heads on the lateral sides of these picture frames personified the Four Continents, while the richly intricate trophies which filled the spaces between the pilasters evoked the Four Times of Day. Out of the combination of classical order, boldly conceived, robustly

Vassé: Galerie Dorée, Hôtel de Toulouse, 1718–19

executed ornament and royal portraiture arose a splendour unequalled in the decoration of the rest of the Château.

Between the programmes at the Hôtel d'Antin and the Château de Petit-Bourg, Vassé embarked on arguably his most important interior scheme, the decoration of the Galerie Dorée at the Hôtel de Toulouse, undertaken for d'Antin's half-brother, the royal bastard, the Comte de Toulouse. In 1713 Toulouse had bought François Mansart's handsome Hôtel de La Vrillière off the Place des Victoires and from 1717 engaged Robert de Cotte to organise the refurbishment of the interior in accordance with modern taste. The Galerie Dorée, as it became known, was situated on the first floor. The vault had been painted in fresco by François Perrier in 1646–49 and the walls were hung with an outstanding collection of Italian and French 17th-century Old Masters which had been purchased by Toulouse along with the house. These elements were to be retained in Vassé's remodelling of the gallery. The aim of Vassé's scheme was principally twofold; first, to bind the elements of the existing decoration, a series of pictures seemingly unrelated by narrative content or style, into a satisfying visual harmony. Second, to deploy about the space ornamental devices and motifs that alluded to the dignity and status of the new proprietor.

In pursuit of a unity of effect, Vassé approached the lateral

walls as a series of fields or panels punctuated by French windows on one side and arched, mirrored recesses on the other. Each of the fields was contained by lavishly carved and gilded Corinthian pilasters, mounted on gently swelling bases and supporting a moulded plaster entablature. At the centre of these circumscribed planes were located the La Vrillière paintings, adapted to fit into uniform frames. It was the design of these frames which constituted one of the novelties of the scheme. Vassé set rectilinear configurations to one side and adopted instead a curvilinear arrangement, composed from coupled volutes yoked together along the upper edge by medallions sporting profile heads, and on the lower edge by cartouches with flanking trophies. Vassé devised similarly *chantournes* borders to reframe the five scenes which constituted Perrier's ceiling, thus imposing a decorative coherence on the scheme as a whole.

At the time of the scheme's devising the Comte de Toulouse had recently acceded to the offices of admiral of France and Grand Veneur and had been appointed head of the Conseil de la Marine. The gallery was to give due celebration to these achievements by an almost obsessive deployment of ornament on the themes of the sea and the hunt. The cartouches on the picture frames, for instance, depicted the famed sportsmen and women and seafarers of classical mythology such as Diana,

Adonis, Neptune and Galatea. The metopes of the frieze, meanwhile, alternately offered scenes of dogs attacking boars or birds and putti playing nautical games. However, it was on the end walls that Vassé expended greatest energy in imagining richly complex schemes of symbolically charged ornament. Indeed, four different projects survive attesting to Vassé's patient elaboration of a scheme for the chimneypiece wall, the realised version of which has recently been characterised by François Souchal as "Baroque" by virtue of the energy and plasticity of its forms and the sinuousness of its lines. Corinthian pilasters of the same family as those on the lateral walls, flank a chimneypiece and its overmantel. Beyond them, in the curvature of the wall, Vassé positioned niches for the display of statues representing two of the Four Corners of the World; the other two being reserved for the opposite end of the gallery. More overt maritime reference is made by the plaster figural group above the mirror which served to link walls and ceiling. The prow of a ship breaks through the entablature, coming to rest on a mask of Minerva and accompanied on either side by Zephyr and by a female personification of Seafaring. On the mantelpiece, meanwhile, Vassé placed bronze infant Tritons, perched on volutes and supporting five-branched candelabra while between them, a monumental shell inscribed with Toulouse's monogram marked the centre of the piece. Double entrance doors, with elaborately decorated upper panels of hunting trophies, provided the focal point of the other end of the gallery. The arched impost surmounting the doors set the scene for a pair of hunting dogs silhouetted against a floral background and shown reaching for a basket of flowers poised on a cartouche. Above them, a larger cartouche framing a stag's head served to link arch and entablature. The plaster group of Diana and her companions, like the rest of the ornament at this end of the gallery, substituted the arts of the chase for those of the sea. Though Pierre-Jean Mariette was on the whole no great admirer of Vassé's figural sculpture, he acknowledged, like all his contemporaries, that the ornament of the Galerie Dorée was unusually fine, and praised the scheme above all for the striking quality of its execution. He regretted only that the passion for brilliance had resulted in such extraordinary workmanship being obscured by a patina of gold.

In his last years, Vassé was extensively employed at Versailles. In 1725 he designed a new chimneypiece and overmantel for the Chambre de la Reine. Such features of the overmantel frame as the lateral palm stems spirally festooned with flowers and the garlands deployed across the mirror surface to link the palms with the wreathed frame of the painting inset above them, indicate Vassé's receptiveness to innovations in interior design and his willingness to introduce such novelties into the most formal and prestigious rooms at the château. More conservative but grander was Vassé's ornament for the Salon d'Hercule, last of the rooms of the king's *grand appartement* at Versailles to be decorated. Between 1729 and 1735 the sculptor designed and executed gilded bronze capitals and bases for the room's 22 Composite marble pilasters, the elaborate wood and plaster cornice, the gilded bronze frames of the two Veroneses, which were the room's principal glory, and the ornament of the monumental marble chimneypiece.

As befits a place dedicated to Hercules, the decorative ensemble evokes power and glory. The rich combination of

marble and gilded bronze and the bold relief of the ornament rarely fails to overwhelm, while the detailed references to the monarchy sustain the Bourbon tradition of the Gallic Hercules. The focal point of the scheme is the fireplace. At the centre of the mantel's flattened arch Vassé placed a head of Hercules coiffed with the skin of the Nemean lion and clasped between volutes of acanthus. Cornucopia overflowing with fruit and flowers rest on the springing arches above jamb-posts decorated with lions' heads. Meanwhile, above the mantel, Vassé devised a trophy made up of palms, oak leaves, a quiver and a shield bearing in relief the seated figure of Hercules at rest. Only in the detail of the picture frames did Vassé occasionally strike a more modern note. Close examination reveals, for instance, that the winged cartouche which crowns Veronese's *Feast at the House of Simon* has a subtly irregular shell-like edging and that the consoles at the lower border sport delicately fluted asymmetrical shells beneath the lions' heads. The salon, arguably the crown's supreme achievement in the field of interior decoration during Louis XV's reign, was inaugurated on the completion of François Lemoyne's vast ceiling in 1736, the year of Vassé's death.

Though connoisseurs, such as Mariette, were severe about the weaknesses of Vassé's figure sculpture, architects, like Charles Briseux, greatly valued the sculptor's contribution to interior decoration. In *L'Art de Bastir des Maisons de Campagne* (1743), Briseux not only remarked upon the "nobility" of Vassé's sculptural forms and the pleasing harmony he was able to establish between the figural and ornamental parts of his compositions, but he more generally acknowledged Vassé as the first artist of his generation to have brought decorative sculpture out of obscurity and to have made it the chief ornament of interior design. That others shared Briseux's approbation is suggested by the silence of Rococo critics in Vassé's case, though they found much for grievous complaint in the compositions of Vassé's not always more original contemporaries Oppenord, Meissonnier and Pineau.

KATIE SCOTT

Biography

Born in Toulon in 1681, the son of the sculptor Antoine Vassé (or Vassez). Trained by his father in the circle of the sculptor Pierre Puget; studied at the Academy of Painting and Sculpture, Paris, 1707. Married: son was the sculptor Louis-Claude Vassé (1716–72). Employed in the service of the Bâtiments du Roi under Robert de Cotte (1656–1735) from 1708; also practised independently as a decorative sculptor from c.1713. Designed shop ornaments and appointed Dessinateur Général de la Marine, 1715. Admitted to the Academy (but not a full member) and given lodgings in the Louvre, 1723. Suffered increasing ill-health from 1731; stopped working 1734; died in Paris, 1736.

Selected Works

Many of Vassé's drawings are in the de Cotte Collection in the Bibliothèque Nationale, Paris; additional drawings and designs are in the Archives Nationales, Paris.

Interiors

- 1709–20 Notre Dame, Paris (sculpture and decoration for the choir and the altar of the Virgin; with Robert de Cotte)
- 1718–19 Hôtel de Toulouse, Paris (redcoration of the Galerie Dorée; building by Robert de Cotte); Comte de Toulouse

- 1723 Château de Petit-Bourg, Évry (interiors including the Salon): Duc d'Antin
 1725–36 Versailles (chimney-piece for the Chambre de la Reine; decorative sculpture for the Salon d'Hercule): Louis XV

Velde, Henry van de 1863–1957

Belgian architect and designer

Trained as a painter, Henry van de Velde subsequently became an architect and designer and was one of the foremost exponents of Belgian Art Nouveau. His early designs were executed in a characteristic curvilinear style and employed simple forms and linear ornament derived from nature. His later work became increasingly rectilinear and less decorative, a development that was in tune with the growing dominance of Modernism. Like many other European designers of the late 19th and early 20th centuries, he strove to create unified interiors where every element was designed by the architect and contributed to the whole (called *Gesamtkunstwerke*) and his work included everything from graphic art and decoration to furniture, silver, jewellery, porcelain and wallpaper. He was active in Belgium, Germany, Holland and France.

Van de Velde was closely associated with avant-garde circles from the very beginning of his career. After studying at the Académie des Beaux-Arts, Antwerp, and in Paris under Carolus-Duran, he returned to Antwerp in 1885 and joined various artistic groups including L'Art Indépendant, an association of young neo-Impressionist painters, and Les XX, a group of avant-garde artists, designers and writers. His paintings of the late 1880s were strongly influenced by the ideas of this group. They were similar to Van Gogh's in form, color, and subject matter, but became increasingly decorative and almost two-dimensional as van de Velde began to develop an interest in architectural theory and design.

Van de Velde's initial interest in applied art stemmed from Japanese art and the work of English Arts and Crafts designers. As a member of Les XX, he was introduced to the writings of John Ruskin and William Morris. Their treatises acted as a catalyst for the development of van de Velde's beliefs that artistic reform lay in the applied arts. In his own work, he rejected the medieval style and hand-crafted aesthetic of Ruskin and

Morris in favor of the creative potential of modern technology. In an 1894 essay on applied art, van de Velde argued that the revival of the applied arts would successfully break down the hierarchy that separated fine art from decorative art and that art could be restored to its former unity.

Although van de Velde abandoned painting and began experimenting with decorative art in 1891, his first designs for tapestries, including *La Veillée des Anges* (1892), displayed the linear quality that had emerged in his later paintings. These flowing patterns of color and line were also to characterize his early interiors. By the following year, van de Velde was thoroughly immersed in design projects.

Van de Velde's earliest complete interior was for his own home, Bloemenwerf, in Uccle, near Brussels (1895), where he first realized his ideas of unified architecture and interior design. The interior displayed the first stages of his creation of large spaces linked together to form a unified whole, as the two-storey central hall integrated the various rooms into an organic unit. This project also marked his first use of light, elegant and unornamented forms which stressed structural purity. He designed the furniture, wallpaper, silverware, and even his wife's gowns with the same simple aesthetic, employing curving lines to accentuate structure and form.

In 1895, van de Velde designed three rooms for Siegfried Bing's new Maison de l'Art Nouveau gallery in Paris; these included a smoking room integrating murals and built-in furniture. He was subsequently invited to design interiors for several exhibitions and galleries in Brussels (1896), Dresden (1897), Tervuren, Belgium (1897), and Munich (1899). In Germany, critics were far more receptive to his simple forms and unified, dynamic Art Nouveau interiors than in France.

Strongly influenced by William Morris's decorative arts workshops, van de Velde founded the Société Anonyme van de Velde in 1897. This workshop, store and interior decorating business, located in Ixelles, near Brussels, manufactured and sold all van de Velde's own designs. His interiors from this period exhibited little separation between the structure of the room and the accompanying forms of furniture. His simple forms and ornament displayed irregular, yet repetitious, outlines that created strong rhythms.

In 1897, van de Velde summarized his ideas about furniture and interiors in an essay published in the Art Nouveau magazine, *Pan*: "a homogeneous piece [of furniture] is preferable to a complex one, a homogeneous room to an unordered, incoherent one. It must be recognized that every room has a principal focal point from which its life emanates and to which all other objects must relate and be subordinate. The various furnishings will be arranged in accordance with this newly discovered skeleton of the room, and thenceforth they will be perceived as the living organs of the room and indeed of the whole house."

After moving to Berlin in 1900, van de Velde established a design studio, although he also worked with several manufacturers to produce his designs in silver, jewelry, glassware, porcelain, and stoves. In the same year, he completed interiors for the Folkwang Museum in Hagen, supplying architectural ornaments, bannisters, balustrades and display cases. In these interiors, van de Velde used ornament to emphasize function: the rise of the staircase steps was emphasized by wave-like motifs, while the bannister incorporated skeletal forms as cast-

Velde: music room, Herbert Esche house, Chemnitz, 1902–03

iron supports. Also, he experimented with spatial interpenetration, whereby light and space pierced the concrete space in ceilings and balustrades.

In the Havana Company tobacco shop, Berlin, 1899, he continued to combine linear and spatial elements, synthesizing two- and three-dimensional structures. The painted frieze supported the ceiling and integrated the differing heights of doorway arches and shelf units, while the smoke-like lines of the frieze evoked the function of the room: namely the sale of tobacco products.

In 1902, van de Velde was appointed artistic counsellor to the Duke of Saxony in Weimar where he became more involved in the design of complete buildings. His first efforts in architecture revealed his foundation in the design of interiors and applied art, and his early buildings resembled enlarged pieces of cabinetry. Commissions from this period include the building and interiors for Herbert Esche's house, Chemnitz, (1902–03); and the interiors of the Nietzsche archive, Weimar (1903). His 1902 interiors of the Weimar apartment for his most important patron, Harry Graf Kessler incorporated free-standing furniture, to allow greater flexibility and informality. These furniture forms were simple, with only slightly undulating lines, and the floors were covered with matting, an innovation in interior decoration.

In 1919, while living in Switzerland, van de Velde was commissioned to design a museum for the private art collection of the Dutch Kröller-Müller family in Otterlo, Holland. His

early designs for the museum show that he was still working in a highly decorative idiom at a time when extreme simplicity was gaining prominence in architectural circles. However, by the time the museum was completed in 1937–38, van de Velde had completely rethought his design and had removed much of the organic ornament so as to focus on the rectilinear structure of the building. His works after 1926 displayed a new simplification of form and decoration. In 1927, he designed a new house for his family near Brussels, La Nouvelle Maison, which reflected the influence of buildings by contemporary architects such as Walter Gropius and Le Corbusier in its solidity and austerity. Yet, unlike his contemporaries, van de Velde continued to use three-dimensional elements to create movement and transition on the exterior and interiors of the building. His appointment as the President of the Belgian artistic committee and architect of the Belgian Pavilion at the 1939 New York World's Fair indicated both the endurance of his reputation as a representative of contemporary Belgian architecture and the recognition of his adoption of a more architectonic style in the 1930s.

CATHERINE L. FUTTER

Biography

Henry Clemens van de Velde. Born in Antwerp, 3 April 1863, the son of a chemist. Studied painting at the Académie des Beaux-Arts, Antwerp, 1881–84, and under Carolus Duran in Paris, 1884–85. Married Maria Sèthe, 1894. Worked as a painter and interior

decorator, Antwerp and Brussels, 1885–94; in private practice as an architect and designer, Brussels, 1895–98; and as Société van de Velde, Brussels, 1898–1900. Moved to Germany, 1900; in private practice, Berlin, 1900–02 (founded Henry van de Velde Werkstatte, 1900); Weimar, 1902–17; Switzerland, 1917–20. Moved to Wassenaar, near The Hague, and succeeded H.P. Berlage as architect to Müller & Co., 1921–25; returned to Belgium and worked as an independent architect and designer, Brussels, 1925–47. A prolific writer, he published numerous articles and books on design and ornament and was an early propagandist for Art Nouveau. Taught design at Brussels University, 1894; founder / director of the Kunstgewerbeschule, later the Bauhaus school, 1908–14; founder member of the Deutscher Werkbund, 1907; founder / director, École Nationale Supérieure d'Architecture et des Arts Décoratifs, Brussels, 1925–36; Chair of Architecture, University of Ghent, 1926–35. A designer in every field, his work included textiles, embroidery, wallpapers, silver, cutlery, furniture, porcelain, jewellery and dress. Retired to Switzerland, 1947. Died in Zurich, 25 October 1957.

Selected Works

Archive material and examples of van de Velde's work are in the Karl Ernst Osthaus-Museum, and the Henry van de Velde Gesellschaft, both in Hagen, Germany. Additional manuscript material is in the Henry van de Velde Archive, Bibliothèque Royale, Brussels. A complete catalogue of van de Velde's architectural projects appears in Ploegaerts and Puttemans, 1987.

Interiors

- 1895–96 Bloemenwerf House, Uccle, Belgium (building, interiors and furnishings): Henry van de Velde
- 1895 L'Art Nouveau Gallery, Paris (design and furniture for 3 rooms; decoration by Georges Lemmen): Siegfried Bing
- 1899 Havana Saleroom, Berlin (interiors and furnishings): Havana Company

Venturi, Scott Brown

American architectural practice; established 1967

With the 1966 publication of *Complexity and Contradiction in Architecture*, Robert Venturi heralded a new era in architecture and interior design. He called for a language of eclectic inclusion, mixing high art references with popular source material and celebrating the “not straightforward” dynamic of American life. His gentle manifesto proclaimed an aesthetic that he described as:

... hybrid rather than “pure,” compromising rather than “clean,” distorted rather than “straightforward,” ambiguous rather than “articulated,” perverse as well as impersonal, boring as well as “interesting,” conventional rather than “designed” accommodating rather than excluding, redundant rather than simple, vestigial as well as innovating, inconsistent and equivocal rather than direct and clear.

(*Complexity and Contradiction in Architecture*, 1966)

Over the next three decades, often in collaboration with wife

and partner Denise Scott Brown, Venturi and his Philadelphia-based firm has employed this vision on everything from urban planning projects to teapots. Their interior design work can be divided into three major areas: designs for interior spaces both public and private, furniture and household wares, and designs for exhibitions, many of which were focussed on the imagery and artifacts of domestic space. Combining aspects of popular culture with fine art, they have created a populist vision from such unlikely sources as the notorious Las Vegas Strip and Levittown (exhibition design for Signs of Life, Renwick Gallery, 1976), nostalgic glimpses into our past (grandmother, tapestry and notebook patterns, cuckoo clock) and historical references (for Knoll's bentwood furniture).

Denise Scott Brown once critiqued the decor of their own apartment from the 1960s when she described "... an austere, modern, concrete setting, and we played dark wood against it – Colonial, Chippendale, Queen Anne, even Victorian things. And then against that we put very stark Pop Art posters It was probably too simple a vocabulary for us." Perhaps the best indication of their interior aesthetic comes from their own house whose large scale lettering and pattern graphics, hybrid couplings of historical bric-a-brac with found objects and existing architectural details can be found in many of the interiors that they have designed over the past three decades.

The effect is often an orchestration of vibrant colors, playful scale shifts and witty intelligence, as in the frieze of great architects' names in the Venturi residence dining room, the outsized window scheme of the Vanna Venturi house, Chestnut Hill, Pennsylvania (1963), the multicolored fixtures and silhouetted columns of a house in Delaware (1982) or the double stepped staircase in Gordon Wu Hall, Princeton University (1983) whose two sets of risers and treads were intended for conversational sitting as well as climbing – both functions typical of a college dorm.

While some of their projects redecorate or add to older revival style buildings, as in the early James B. Duke House interiors, New York (1958) or the Allen Art Museum, Oberlin College, Ohio (1973–76), most of their interior work consists of creating appropriate interiors for the firm's primary practice. Until recently, most of their design work was residential; in the 1980s they began to receive highly visible projects in universities and museums including numerous buildings and interior designs for Princeton University and the University of Pennsylvania, exhibition designs for the Whitney Museum, the Smithsonian Institution and the Philadelphia Museum of Art as well as new facilities for the Seattle Art Museum (1986–92) and The Sainsbury Wing, National Gallery of Art, London (1991).

The vitality and breadth of their sensibility can often be understood from a single project like their design for the renovation of the San Diego Museum of Contemporary Art (1987–94). On the interior, they reference a complex multiple-view corridor articulated spatially through a windowed stairwell, uncover the fenestration of a historical building by early modern architect Irving Gill and employ a light-hearted "pop" dalmatian-spotted pattern for floors. They also use an ornate central domed court as a kind of hinge around which the rest of the museum is arrayed while simultaneously reintegrating the entire building into the fabric of its surrounding neighbor-

hood through adjustments of scale and composition on both interior and façades.

Filled with scholarly knowledge, ironic wit, a planner's vision and a kind of irreverent respect for the past, they have managed to influence a generation of architects through their built projects, their writings and their teaching. Some of their most moving contributions to interior design have been in terms of published writings over three decades, including Venturi's, *Complexity and Contradiction, A View from the Campidoglio* by Venturi and Scott Brown 1984, Scott Brown's 1983 essay on "Changing Family Forms" and her earlier "Remedial Housing for Architects Studio" and with Venturi and Steven Izenour, "The Home" (all reprinted in *Architectural Monograph*, no. 21, 1992). Venturi is fond of saying "God is in the details." He and Denise Scott Brown continually strike a balance in their texts and designs between a delight with the minutiae of popular culture, a studied analysis of historical forms and a serious concern with contemporary social patterns. For them architecture and interior design are ways to fill in the gap between life and art.

Robert Charles Venturi. Born in Philadelphia, Pennsylvania, 25 June 1925. Studied architecture, Princeton University, New Jersey, 1943–50; attended the American Academy in Rome on a Prix de Rome Fellowship, 1954–56. Married the architect Denise Scott Brown, 1967: 1 son. Worked as a designer in the offices of Oscar Stonorov, Philadelphia; Eero Saarinen, Bloomfield Hills, Michigan; and Louis I. Kahn, Philadelphia, 1950–58. Partner with Paul Cope and H. Mather Lippincott, Philadelphia, 1958–61; partner with William Short, Philadelphia, 1961–64; partner with John Rauch, 1964–89, and with Rauch and Denise Scott Brown, 1967–89. Principal, with Scott Brown, in Venturi, Scott Brown and Associates, Philadelphia, since 1989. Instructor, then Associate Professor of architecture, University of Pennsylvania, Philadelphia, 1957–65; Charlotte Shepherd Davenport Professor of Architecture, Yale University, New Haven, Connecticut, 1966–70; Walter Gropius Lecturer, Graduate School of Design, Harvard University, Cambridge, Massachusetts, 1982; Board of Advisers, Department of Art and Archaeology, Princeton University, 1969–72 and since 1977; and teaching at various other institutions. Has published numerous articles and books on architecture and design since the 1950s. Many prizes and awards including Pritzker Architecture Prize, 1991; National Medal of Arts, US Presidential Award, 1992; Benjamin Franklin Medal, Royal Society for the Encouragement of Arts, Manufacture and Commerce, 1993. Fellow, American Institute of Architects; Honorary Fellow, Royal Institute of British Architects.

Denise Scott Brown. Born Denise Lakofski in Nkana, Zambia, 3 October 1931; emigrated to the United States, 1958, became citizen, 1967. Educated at the University of the Witwatersrand, Johannesburg, 1948–51; trained at the Architectural Association, London, 1952–55; studied under H. Gans, Louis I. Kahn and others at the University of Pennsylvania, Philadelphia, 1958–60: M.Arch. 1965. Married 1) Robert Scott Brown, 1955 (died 1959); 2) the architect Robert Venturi, 1967: 1 son. Architectural Assistant to Ernő Goldfinger, and Dennis Clarke Hall, London, 1955–56; assisted Giuseppe Vaccaro, Rome, 1956–57, and Cowin, DeBruyn and Cook, Johannesburg, 1957–58. Associate Professor, School of Architecture and Urban Planning, University of California at Los Angeles, 1965–68. Worked as Architect and Planner, and later Partner, with Robert Venturi and John Rauch, in Venturi and Rauch, 1967–80; partner, Venturi, Rauch and Scott Brown, 1980–89; Principal, Venturi, Scott Brown and Associates, since 1989. Has published

numerous books and articles on architecture and design; has taught at many universities including Yale University School of Architecture, New Haven, Rice University, Houston, and University of California at Santa Barbara. Member, Architectural Association, London, and American Planning Association; Associate of the Royal Institute of British Architects.

Selected Works

A full list of Venturi, Scott Brown's architectural projects and commissions appears in Moos 1987, and *On Houses and Housing* 1992.

Interiors

- 1958 James B. Duke House, New York (interiors)
- 1963 Vanna Venturi House, Chestnut Hill, Pennsylvania (building and interiors)
- 1973–76 Allen Art Museum, Oberlin College, Ohio (renovation, additions and interiors)
- 1974 Brant House, Greenwich, Connecticut (building and interiors)
- 1979 Knoll International Showroom and Conference Room, New York (building and interiors)
- 1980 Venturi, Rauch and Scott Brown Offices, Philadelphia (building and interiors)
- 1981 Houston Hall Student Center, University of Pennsylvania, Philadelphia (interiors)
- 1982 Venturi, Scott Brown House, New Castle County, Delaware (building and interiors)
- 1983 Gordon Wu Hall, Butler College, and alterations to Wilcox Hall, Princeton University, New Jersey (alterations and interiors)
- 1986–92 Seattle Art Museum, Seattle (building and interiors)
- 1987–94 San Diego Museum of Contemporary Art, La Jolla, California (additions and interiors)
- 1991 Sainsbury Wing, National Gallery, London

Venturi has designed furniture, fabrics, and tableware. His furniture includes work for the Formica Corporation, New York (1983), and seating for Knoll International featuring the *Chippendale* bentwood and formica chair (1984); he designed a tea and coffee set for Alessi International, Milan (1983 and 1985). Other work includes designs for Fabric Workshop, Philadelphia (1983), Swid Powell, New York (1984–85), Elective Affinities, Milan (1985), Arc International, Milan (1985), Reed and Barton, New York (1989), and Hanssem Corporation, Seoul (1990).

Vernacular Tradition

Discussions of vernacular traditions in design have, in the past, been hampered by the vocabulary used to describe those traditions. Most descriptions of vernacular buildings and furnishings have, until recently, been characterized by inappropriate words, such as "naive", "folk art", "peasant art", "unselfconscious", "rustic" or "anachronistic". These words are still in use in descriptions of vernacular design today and the word "folk", for want of a better term, is often used by auctioneers to define furnishings which fall outside the fashionable products of the 18th and 19th centuries. It is equally problematic to define the vernacular as a style. This description assumes a congruence of distinctive and unifying factors, which lead to a process of development and, in turn, provide a source of influence for a defined group of furnishings, interiors and buildings.

Further problems arise due to the relative lack of academic attention devoted to the vernacular. Similarly, no seminal figures are known to have emerged from the various vernacular traditions or to have diverted the course of those traditions (development and diffusion of style in the vernacular tradition were usually mediated through one or two members of discrete regional groupings). This is not to say that the vernacular fails to exhibit a distinctive manner or share common characteristics in terms of materials, design and ornament; nor that the various traditions were immutable or static; nor that many 19th- and 20th-century architects, writers and designers were unaffected by the supposedly "anonymous traditions" of craftsmanship exhibited in rural communities, with which they were familiar. However, to speak of the Vernacular Style is to simplify and homogenize a series of vibrant and diverse traditions of culture, design and manufacture, which have, until recently, been unsatisfactorily categorized.

The root of the word "vernacular" means native or indigenous. The word in relation to language, carries meanings of homeliness, lack of foreign origin or learned formation. The vernacular has been associated with rural society and culture and in Britain has been linked by authors such as Raymond

Williams with notions of the English rural myth, deriving largely from the output of 19th-century commentators, including William Morris (Williams, 1973). Within the constructs of this myth, country people of the artisan class were thought to be living harmonious lives and to have developed an untutored and unselfconscious feeling for nature. The work of country craftsmen was perceived in moral terms. Their products – whether buildings, furniture, ceramics or weaving – were thought to be honest and unsophisticated material expressions of the fundamental necessities of life and the “solid virtues”. These interpretations of the vernacular failed to perceive that during “the 18th and 19th centuries, Britain was not an homogeneous nation, but rather a series of distinct regions, some persistently rural, others becoming increasingly industrialized, all of which developed their own special form of cultural life, both material and social” (Cotton, 1990). There is still the perception in some studies that the vernacular was a stable and unalterable tradition and that those producing objects in that tradition were unaware or uninterested in developments beyond their immediate surroundings. This partial view of pre-industrial rural communities has been challenged by recent work on the vernacular. Writing on an item of slipware pottery, Darron Dean for example, has remarked that “An object’s vernacularity is ... a product of the varying ways appropriated forms, materials, and processes are reconstituted in and for a locality, rather than being an organic and unproblematic manifestation of local culture” (Dean, 1994).

Vernacular design has also usually been defined by what it is not – in other words, the traditions of vernacular design have been perceived as wanting in relation to established, hierarchical and traditional art historical notions of high style and fashionable or elevated taste. How then can the vernacular, in Britain and elsewhere, be defined? Local values, materials and local craft practice were important elements of this tradition in many regions. These may include the use of building material from the immediate vicinity, such as Cotswold limestone or the use of knapped or shaped flint and brick lacing courses in Wiltshire. They may also include the use of locally grown, indigenous timbers in furniture making and the use of traditional motifs, including flying wheels and heart motifs in the Celtic countries, such as Ireland and Wales. These traditions, however, were not fixed but evolved and developed through contact with other cultural forms. These inputs or cultural influences from other regions were filtered by local preference from “a broader social, economic, and technological framework” (Dean, 1994).

For buildings to warrant the description vernacular they must have evolved from local or regional traditions rather than from academic ones, and they have to provide for the basic activities of ordinary people in the particular vicinity. They must be strongly related to place and local, non-imported materials must be used in their construction. They must also have been designed “with thought and feeling” rather than in “a base or strictly utilitarian manner” and they should exhibit in Nikolaus Pevsner’s words “conscious aesthetic intention”. One of the most useful ways to think of vernacular design is in spatial terms rather than in opposition to hierarchical notions of taste, when “a code of elevated taste and of a prevailing culture holds sway”. Regionality, as Pevsner goes on to state “and the marked differences which regions, had one from

another ... provided powerful influences both physical and cultural” over vernacular design (Cotton, 1990).

The variations and gradations in the living conditions of the rural poor from region to region ensured an uneven development of local, vernacular traditions of design. Thus the development of the vernacular in terms of building, furniture making, weaving and ceramic manufacture, for example, differed widely from region to region and becomes problematic to fit into the normal parameters of stylistic development. This applies to the British Isles, as well as other Continental European countries. (Works by R. W. Brunskill and others have examined the development of the traditions of vernacular building in Britain; vernacular traditions within material culture have recently been the subject of investigation by V. Chinnery, B.D. Cotton, C. Gilbert, C. Kinmonth and others.) Discussion of the development of vernacular buildings has included the examination of the significance of the hearth in the design of houses in the British Isles. Dramatic differences in the use of the hearth and the arrangement of room plans and furnishing schemes have been recorded by researchers such as Brunskill. For example, there is a stark contrast between the development of the inglenook or “room within a room” in the North of England during the 17th and 18th centuries as a source of heat and light and the central, hearth peat fire of the “Black House” found in the Highlands and Islands region of Scotland, reflecting the enormous gulf between the material conditions of the different rural populations of the British Isles during the 18th and 19th centuries.

The same diversity can be seen in the development of vernacular furniture design. Vernacular traditions of design can encompass the “hedge chairs” of Ireland, made with “found” or naturally bent “knees” of wood, in order to maximise the shortage of timber, which existed in that country from the 18th century. They can also encompass the varying and sophisticated interpretations from region to region of the Windsor chair, which is characterized by a shaped wooden seat into which the legs and back support, spindles and splats were morticed. The elaborate regional traditions of this category of chair have been documented by Cotton, where, for example, he traces the evolving forms of the Macclesfield ladder-back chair and Nottinghamshire Windsor chairs made by the Gabbitass family. A particular group of makers in Macclesfield constructed their chairs of stained ash, and developed a distinctive stay or top rail, the ends of which were of elongated, ovoid form and may reflect the design of a turned wooden device used in the silk manufacturing trade in that town. The Gabbitass family produced yew and elm Windsor armchairs in the North East Midlands with characteristic turned legs and arm supports.

The development of vernacular traditions of design have been documented in other European countries, such as France and outside Europe in countries such as Japan. Work by Denise Gluck in *Le Meuble Régional en France* (1990) and by others has examined the variations of vernacular furniture by region in that country, including the products of the Poitevin chair-makers Morrault, and the diverse regional variations of vernacular furniture design in France. The existence of a vernacular or “folk craft” tradition has also been documented in Japan. This tradition existed as a separate and identifiable grouping within Japanese culture and comprised functional

objects such as the glazed stoneware products of the Tohoku region, the split and woven bamboo baskets of Arima and the technically uncomplicated pre-dyed and patterned yarns called *Kasuri*.

Vernacular traditions had a profound effect on social critiques, architecture and material culture during the 19th century, at a time when the relative certainties and stability, from which these traditions evolved, were breaking down through changes brought about by greater industrialisation, social mobility and the erosion of the distinct regionality which had given the traditions their cohesiveness. During the 19th and part of the 20th century, in Britain and in other countries, the interest in, and influence of, vernacular traditions can be seen as a reflection of society in change, where the myth “of rural life as the central generative influence in vernacular ... design, remains ... as part of this (and other) nations’ self-perception as an agrarian nation” (Cotton, 1990). The vernacular traditions of both European and non-European nations affected the material culture of those nations, but British commentators, designers and artists played an important role as interpreters of the vernacular. One of the most important of those interpreters and propagandists of the vernacular tradition in Britain was William Morris, whose Utopian socialism in such works as his lecture “The Beauty of Life” (1880) was a formative influence on the Arts and Crafts movement in England. Morris and his circle perceived both the “essential virtue” which they believed was present in vernacular design and in the craft products associated with rural societies and evidence of an heroic and romantic survival of craft traditions in which nature and art found perfect fusion. Manifestations of these perceptions led to the creation of such items as Morris and Co.’s *Sussex* chair produced from 1864, which is thought to have been copied by Ford Madox Brown from a type of chair found in that county, but which may, in fact, not have had rustic origins at all.

Architects also sought inspiration from the vernacular. George Devey’s work establishes him as a major influence on the development of the vernacular revival of the 1860’s in his use of the Wealden style and his incorporation of elements from Continental vernacular, including the re-introduction of Flemish elements found in East Anglia. Devey also influenced the emergent Arts and Crafts movement with his interest in the use of local materials and building techniques. Later architects, such as C.F.A. Voysey also incorporated vernacular elements into their designs.

Architects and designers of the Arts and Crafts movement were deeply affected by Morris’s perception of the vernacular traditions of design. A seminal connection between the movement and a particular vernacular tradition exists in the turned ash ladder-back chairs made by the Herefordshire chair-maker, Philip Clissett. The design of Clissett’s chairs was a traditional one, deriving from a type found in the West Midlands and made for a local market. In 1886 Clissett was “discovered” by the architect James Maclaren, who suggested changes to the basic design of the chairs. The resulting artifacts were highly influential and widely seen and in some cases copied by most of those involved in art and design in Britain in the 1880s, largely through exposure at the Art Workers’ Guild and also due to the romantic notion that Clissett demonstrated contentment with his rural craft by singing as he worked. Many Arts

and Crafts designers, including Ernest Gimson and C.R. Ashbee made their own versions of the rush-seated, ladder-back chair. Arts and Crafts training encouraged architects and designers to study buildings and interior fittings and to concern themselves with the trades and crafts involved in building. Thus, the writings of Morris, inspired by the rural craft traditions with which he was familiar, directed designers and architects towards the acquisition of practical craft skills, such as furniture making or metalworking and influenced the formation of art and craft workers’ guilds.

Distinct and identifiable traditions of vernacular design evolved despite and, in many cases, because of the material poverty of much of the rural population of the British Isles. Many of the dwellings which the rural poor inhabited were not intended as permanent structures and can be said to have had little or no influence on fashionable interiors. Until recently little, if anything, was known of the makers of a range of vernacular artifacts. Even the various members of the Arts and Crafts movement failed to give recognition to the actual makers of these items, which were so influential in their own lives and few, if any, seminal figures (with the possible exception of Philip Clissett) from the diverse vernacular traditions of Britain are known. It was the buildings, furniture, ceramics and weavings – the inanimate objects and the artifacts themselves, which inspired and shaped 19th-century perceptions of the vernacular and transferred on design motifs, working practices and design concepts into the late 19th and 20th centuries. These vernacular objects influenced those interested in art and design from succeeding generations in different ways. Gertrude Jekyll, the Edwardian garden designer and writer, was conscious when writing at the start of the 20th century that traditional vernacular objects were disappearing from the houses of rural Surrey and being replaced with, in her view, inappropriate, cheap and fashionable furnishings, which “debased the homely dignity and comfort of the farmhouse parlour into an absurd burlesque of a third-rate drawing room”. During the first half of the 20th century writers, such as Arthur Hayden in *Chats on Cottage and Farmhouse Furniture* and Gordon Roe in *English Cottage Furniture and Windsor Chairs* looked at vernacular design from the viewpoint of the antiquarian and collector with regard to the acquisition of, and furnishing with, vernacular furniture. These and other writers formed part of the same stream in the romantic, ruralist tradition of Morris and members of the Arts and Crafts Movement.

The vernacular, as manifested in the ruralist tradition, had an equally striking though limited effect on certain interiors in the early 20th century in Britain, as it was bound up with ideals of the simple life. There was a belief among a progressive segment of society that civilisation had become over-complex and the old accretions needed to be swept away. This viewpoint involved an attempt at the dismantling of social barriers, but also meant that conditions of living needed to be simplified. Ideally this simplification should consist of a country cottage with few possessions. Edward Carpenter’s cottage of Millthorpe, Derbyshire, visited by the Ashbees, was seen as a representation of this ideal of rustic simplicity. The influence of vernacular traditions during the late 19th century in the adaptation of rural idioms and a regard for sturdy, unpretentious structures encouraged the development of “the

cult of the profoundly ordinary into almost a national style" (MacCarthy, 1982).

The vernacular traditions of design in other countries had lasting effects on the works of artists and designers of the 19th and 20th centuries in those countries. The perceptions and ideals of the British Arts and Crafts movement also affected how other countries perceived their own rural, craft-based traditions. In France, around 1900, there was a renewed interest in vernacular forms of furniture, and furnishing schemes, from the different regions of France. This renewal of interest had an economic imperative, which had been spelled out in the International Exhibitions of the time – to reinvigorate the economically depressed artisan class. There was also in France a desire to "modernise" vernacular forms of furniture. This latter desire led to the strange mix of folkloric detail with Jugendstil aesthetic in the *Alsace* chairs created by Charles Spindler in 1900, and the later attempts by René and Maurice Coz in the early 1940s to create modern furniture and interiors, which still retained the elements of traditional, vernacular design for Brittany farmers.

In other parts of Europe, particularly in eastern and central European countries, such as Russia and Hungary, the shared regional characteristics, derived from their common feudal, social and political situations, led to the perception, in the late 19th century, of the vernacular as a means of preserving historic cultural traditions. In Russia, for example, from the 1880s a concerted effort was made to revive vernacular traditions of design and manufacture in the decorative arts with the encouragement of the *kustar* or rural cottage industries, which had been a major part of Russia's rural economy from the 17th century. Wendy Salmond has described the role of the local government bodies or *zemstvos* in the regeneration of the *kustar* (Salmond, 1996). These bodies set up training workshops to encourage the perpetuation of hand skills and included such outlets as the Abramtsvo carpentry workshops run by Elizabeth Mamontova. In 1885 a *kustar* museum was opened in Moscow, exhibiting examples of peasant art, which was to serve as a nucleus for the revival of rural cottage industries for the whole of Russia. Professional artists were encouraged to upgrade *kustar* products. For example, Elena Polenova produced designs for carved furniture inspired by the vernacular examples with which she was familiar, and the perceived emblem of Russia's folk tradition, the *matrioshka* doll was, in fact, designed by the artist Sergei Maluitin in 1891 for a fashionable Moscow toyshop. The revival of the vernacular in Russia took a particular form and stemmed from the desire to "civilize" and formalize the art of the rural poor. "The Russian peasant's ignorance of the basic academic laws of drawing anatomy and perspective was regarded an unfortunate defect to be remedied through education. The quality of *kustar* art most highly prized was rather an emotional primitivism that emphasized the "iconography" of peasant art and life - its ornament and customs" (Salmond, 1996).

In other Eastern European countries, such as Hungary, the vernacular was perceived as being of more fundamental importance, in that vernacular traditions were seen as the repositories of ancient cultural forms, which, in the last decades of the 19th century, were appreciated as the basis for a new national culture. In Hungary the non-academic characteristics of local "folk" art were more highly valued than in Russia and a

perception developed of the distinct regionality of the various vernacular traditions in that country such as, for example, the Blackware pottery of Nadudvar and the primitive, riven arks of the Paloc region. Changes in the value system of art (reflecting similar changes in Britain) and a deepening appreciation of Hungary's vernacular traditions saw the creation of artists' colonies such as the Gödöllő Colony, where handicrafts, such as weaving, carving and embroidery were thought worthy of the attention of conventionally educated artists. Around 1900, intellectuals and artists in Hungary, such as Aladár Körösfői-Kriesch and Odon Moiret (as in other Eastern European countries, such as Poland) saw indigenous, vernacular traditions as an entirely appropriate and renewable source of ideas, with deep historical roots, which could form the basis of a particular, new national style.

In America, the Shaker communities in New York state provided a perfect indigenous example of the Arts and Crafts ideal. Isolating themselves from the modern world, these communities preached spiritual purity and honest craftsmanship in everything they made. Shaker slogans seemed to epitomise the fundamental truths of the vernacular in design – "regularity is beauty" and "beauty rests on utility". By 1860 the Shaker vernacular had become fashionable on the East Coast of America but was gradually superseded by English Arts and Crafts ideals. Other vernacular traditions existed within the broader material culture of America, including the production of artifacts, such as quilts by the Amish of Lancaster County, Pennsylvania, the ash and willow baskets of Nantucket, Massachusetts, and the simple, cobalt blue decorated, salt-glazed stonewares of the Fort Edward pottery, New York. The vernacular, as diffused through Arts and Crafts ideals, was also influential in the work of Gustav Stickley of Syracuse, New York. Furniture-maker and stonemason, Stickley was deeply influenced by the ruralist and utopian visions of Morris and his followers. He produced *The Craftsman* magazine (from 1901), which widely publicised Arts and Crafts ideals in America. He hoped that "reform would seem to be in the direction of a return to the spirit which animated the worker of a more primitive age, and not merely to an imitation of their method of working ..."

In Japan, vernacular traditions of design had existed beside the objects produced for primarily elite taste. These "folk crafts" began to receive serious attention in the early part of the 20th century. They were first discussed by Yanagi Soetsu (1889–1961), the founder of the nationalistic *Mingei* or Japanese Folk Crafts movement. The aesthetic theory of the movement emphasized the supreme beauty of hand-made folk crafts for ordinary use, made by unknown craftsmen, working close to nature, using simple techniques and traditional styles and living in settled, rural communities. This movement can be seen, with the ruralist traditions in the West, as part of recent urban society's reaction to rapid industrialization, where the stabilizing links with rural community life of the past are sought.

The vernacular traditions of design, inherent in many countries, have contributed to the formation of distinct, national styles in those countries, in the modern age. The particular and distinctive characteristics of vernacular traditions, the ancient individualities and differences expressed from region to region, which have reinvigorated the products of artists and designers

since the 19th century, can be viewed as part of the process of modernization of design. This creation of modern, national identities and the process of design modernization can, paradoxically, be better understood through the assimilation of past, vernacular traditions, and the comprehension and absorption of these traditions. As Enid Marx states in *The Maker's Eye* (1981), with reference to design in Britain, "Traditional art – folk-art – is, I think, very important. It has not been nearly as fully recognized in this country as it has been abroad, yet it is our roots, and without roots, nothing grows." And the design historian Fiona MacCarthy has observed that the "countrified tradition" in Britain, which derives from the various regional, vernacular traditions, has descended through the woodworkers, potters and handweavers of the 1920s to the many and varied craft workshops of today and has also, less directly, affected progress of design for British industry. The inspiration of national, vernacular traditions to those concerned with design can be characterized in different ways, depending on the country. In Britain, the varied vernacular traditions have bestowed a "quality of reticence" and a "creative kind of modesty", which is central to the British tradition of designing and which could be summarized as "the imaginative handling of the commonplace".

Vignelli Associates (Massimo Vignelli 1931– and Lella Vignelli 1936–)

American industrial, graphic, architectural and interior design firm

Massimo Vignelli was born in Italy and studied art and architecture at the University of Venice. In 1965 he was a founder with Jan Doblin and Bob Noorda of the graphic and industrial design firm Unimark in Milan. In 1966 the firm opened an office in New York with clients that included Knoll International, Gillette and Olivetti. In 1971, the firm of Vignelli Associates was founded with Lella Vignelli, also a graduate of the University of Venice in architecture.

The Vignelli firm works in graphic and industrial design as well as in interior design. Graphic design and packaging projects have been produced for such clients as American Airlines, Ford and Lancia, the New York and Boston transit systems and retail stores including Bloomingdale's, Barney's and Saks Fifth Avenue in New York. Product designs include plastic dinnerware for Heller, glassware, jewelry, silver and exhibit design for a variety of clients. Vignelli-designed furniture has been produced by Knoll and Sunar Hauserman. The stacking chair for Knoll, known as the *Handkerchief Chair* for its plastic seat and back unit suggestive of a tossed rectangle of cloth, has been particularly successful.

Work by the Vignellis in interior design has included the firm's own New York offices, showrooms for Artemide in Milan, New York, Chicago, Dallas, and Los Angeles, Italcen in Chicago, Poltronova in New York and offices and showrooms for Kroin in Cambridge, Massachusetts. The 1982 showroom for Hauserman in Los Angeles made use of brilliant colors and effects of lighting to create spaces that can be understood as abstract works of sculptural character. The Grand Rapids, Michigan furniture firm Steelcase became a client in 1992–93 for showrooms and graphic elements that display finishes and textiles in visually exciting patterns.

In 1977 the city-block-square building for Citicorp in New York called for the demolition of a church that occupied a corner of the site. A new church was incorporated in the old location, beneath the towering mass of the Citicorp Center. The new St. Peter's Lutheran Church (with architectural design by Hugh Stubbins) contains Vignelli interiors of great beauty. All furniture, colors and materials are of coordinated design of exceptional quality. Even the church vestments and liturgical vessels are of highly original forms developed by the Vignellis.

The Vignelli aesthetic remains clearly loyal to the orientation of Modernism as it developed in the 1920s and 1930s. At a time when various challenges, such as those of Postmodernism and Deconstructivism have emerged to question the basics of Modernist theory, the Vignelli direction,

often described as tending toward Minimalism, has served to demonstrate the validity of Modernist concepts in both aesthetic and commercial terms. The basic logic and directness of Vignelli design offers a certain timeless quality in an era of questioning and uncertainty in design thinking.

Many honors and awards have come to the Vignellis as individuals and to the firm of Vignelli Associates. Among them have been a Compasso d'Oro from the ADI in 1964, a 1973 medal from the American Institute of Architects, the 1983 medal of the American Institute of Graphic Arts and honorary doctorates from the Parsons School of Design and from Pratt Institute.

JOHN F. PILE

Selected Works

Examples of Vignelli's furnishings and products are in the Museum of Modern Art, New York, and the Tel Aviv Museum.

- 1964 *Saratoga* chair and sofa for Poltronova
- 1974 Minneapolis Institute of Fine Arts (exhibition layouts and office interiors)
- 1976–77 St. Peter's Lutheran Church, New York City (interiors)
- 1979 *Acorn* chair and *Rotunda* chair: Sunar
- 1980 Barney's, New York City (shop interiors)
- 1981 Hauserman, Chicago (showrooms)
- 1982 Hauserman, Los Angeles (showrooms)
- 1982–87 *Handkerchief* chair for Knoll; with David B. Law, produced 1991
- 1984 Italdesign, Chicago (showrooms)
- 1985 *Serenissimo* table for Acerbis
- 1987 Artemide, New York and Chicago (showrooms)
- 1990 *Magpie* illuminated coffee table for Morpho
- 1994 Designer's Collezione, Pasona International, Tokyo (shop and interiors)

Massimo Vignelli has also designed furniture for Poltronova (1964–71), Suran (1971), Poltrona Frau (from 1987), and Rosenthal. The firm's corporate identity commissions include Knoll International (1966), Lancia automobiles (1978), and Ciga Hotels (1979); they have designed ceramics and glassware for Sasaki (1985–87).

Viollet-le-Duc, Eugène 1814–1879

French architect, antiquarian and designer

Born into a cultivated Parisian family, Eugène Viollet-le-Duc was familiar from his earliest years with Romantic artists and writers. He also had family connections with building. His father held the appointment of supervisor of the royal residences under Louis-Philippe, who had admired the drawings of the obviously talented youth who chose architecture as his profession and became what Sir John Summerson has called "one of the two supremely eminent theorists in the history of European architecture". But he was not only a theorist and a prolific author. He was an extremely active architect and designer of decorative arts who based his work on a profound knowledge of medieval buildings, which he believed provided a basis for a new contemporary philosophy of design.

In 1836 Viollet-le-Duc set off on a long tour of Italy, during which he produced a large number of brilliant drawings and watercolours which reveal a growing appreciation of classical architecture and decoration that complemented his first (and lifelong) enthusiasm for the Middle Ages. The drawings also confirm his appreciation of the importance of colour in architecture. In Messina there was the painted woodwork of the cathedral roof; in Palermo there was Islamic and Arabic decoration as well as the Palatine Chapel in which he admired how the light glided and shimmered over the mosaic-covered walls. In Rome he spent much time drawing and painting decorated floors and furnishings and Raphael's decorations in the Vatican. Venice seduced him: "If I had a great fortune I could think of nothing better than to live here for three or four months in one of the palaces, which could be put back with a little effort to its original state". In that thought we have a presage of Viollet-le-Duc's future career as the best-known restorer of France's historic monuments.

His first important commission was in 1840 when he began the restoration of the church of La Madeleine at Vézelay, and this was followed by many churches and cathedrals. The basic principle on which he worked was that "every building and every part of a building [which included decoration and furnishing] should be restored in its own style"; and none knew more than he about medieval architecture, decoration and furnishing. During the years between 1858 and 1868 he published the monumental ten-volume *Dictionnaire raisonné de l'architecture française du XI au XVI siècle*, and from 1858 he produced the companion dictionary to French furniture from the Carolingian period to the Renaissance. In his great *Dictionnaire* Viollet-le-Duc wrote of the separation between architecture and painting which had occurred since the Middle Ages and the Renaissance. The architect "neither conceived nor realised the effect which painting was to produce on the surfaces which he prepared", while the painter regarded them as "pieces of canvas stretched in a studio far less convenient than his own". The most important example of his painted decoration in an ecclesiastical building was in Notre Dame,

Paris, and these murals were reproduced in a chromolithographic publication in 1870. Whether or not the colours used and the formalised motifs based on nature were accurate reconstructions of medieval decoration may be open to question, but Viollet-le-Duc claimed he was following precedents in, for example, deciding whether the colouring in a particular chapel should be cool or warm, and in the predominant use of secondary and tertiary colours.

Viollet-le-Duc's restorations were principally of ecclesiastical buildings; but in 1857 he was instructed by Napoleon III to rebuild the ruined castle at Pierrefonds, and six years later the Emperor extended the commission to include the decoration and furnishing of the interiors. In this case the work cannot be called restoration; it is entirely the result of Viollet-le-Duc's imagination in response to the Emperor's instructions to create a romantic setting for his luxury-loving court. It is a vision of the Middle Ages seen through rose-tinted, trefoil-framed spectacles.

A watercolour of the *grande salle* made by Viollet-le-Duc in 1858 evokes the character of this dream castle; every surface is richly modelled and painted, and the walls are covered with tapestries below a deep frieze out of which angels bearing shields emerge to support the moulded beams of the ceiling. A fire blazes in a huge fireplace decorated with an imperial cartouche, and the floor is covered with a richly coloured carpet. The Emperor is seated reading on an enormous overstuffed crimson sofa with an elaborately crested oak frame, his feet resting on a stool, while the elegant Empress stands with a cup of tea in her hand. The other furnishings are comfortably buttoned. But if this is what the imperial couple wanted, Viollet-le-Duc nevertheless made use of his knowledge of medieval decoration in detailing the carved and waxed oak panelling and the stencilled, painted walls. In the Emperor's bedroom the architect himself painted a frieze on a knightly subject, using ochre and blue which contrast with the red ceiling beams. Floral motifs, birds and branches twine around the walls and ceiling of the Empress's bedroom, and in the great hall there are *trompe-l'oeil* window curtains hanging from painted cords – a wishful thought of medieval comfort.

Viollet-le-Duc's work at the Château d'Eu from 1874 for the Comte de Paris was similar in elaboration and colour, and he himself provided the cartoon for one of the wall paintings. This commission included furniture which, as his great-granddaughter said, "has nothing Gothic about it. If anything, it is a foretaste of the highly refined aesthetic of the Twenties". At the Château de Roquetaillade, Viollet-le-Duc was responsible for the restoration for the Marquis de Mauvesin in the 1860s, but the rich decoration and furnishing in the Pierrefonds manner was the work of Edmond Duthoit.

Paradoxically, the architect who was able to realise a mid 19th-century dream of the Middle Ages in all its intricacy and colour was also an advocate of austerity and honesty of structure in his designs for new buildings. He accepted with enthusiasm the new materials, especially iron, and in his *Entretiens sur l'architecture* (1863–72) he wrote of utilising them "without the intervention of traditions that have lost their vitality". His designs for Parisian houses, including his own at 68 rue Condorcet (1862–63) and Maison Milon, 15 rue de Douai (1860–61), incorporated only slight references to a Gothic style although basically they were derived from a

medieval precedent. The entrance hall in the former had paving that included cats, mice and spiders, and the wall decoration was Egyptian in style; Viollet-le-Duc's great-granddaughter remembered "little painted capitals and small engaged columns". Many of his designs for furniture were recalled as "very sober and functional, and always made of polished oak ... [Some] were both inspired by Gothic art and very effectively devised: examples of severe Gothic". Some of his designs were pointing the way to Art Nouveau, to Victor Horta, Hector Guimard and H.P. Berlage.

In 1873 Viollet-le-Duc wrote and illustrated *Histoire d'une maison*, in which he tells in the form of a novel how a schoolboy was instructed by his architect-cousin how to design and supervise the building of a house. The interior is described as "though simple ... in good taste; there was nothing to be seen in the way of plaster ornament or gilding". The entrance hall had a natural, waxed oak wainscot above which "the walls, painted stone colour, set off by a few red lines, gave a neat and inviting aspect". In the drawing room the wainscot was painted white, there was painted canvas on the walls and the ceiling was "painted in light tones set off by black and white lines"; the room was flooded with light through a bay window furnished with a chintz-covered divan. The dining room and the billiard room were darker in colour, with oak wainscoting and painted hangings, and the former was furnished with built-in sideboards. It has been suggested that Frank Lloyd Wright gained some ideas from this. It was another world from Pierrefonds. The similarity of these and Frank Lloyd Wright's early interiors is confirmed by the latter's son's recalling how he was given a copy of the English translation of *Entretiens* and told he would find there all the architectural schooling he would ever need.

After the collapse of the Second Empire, Viollet-le-Duc seems to have felt some remorse for his collaboration with Napoleon III's administration, and he devoted most of his time to writing. Towards the end of his life he built a chalet, La Vedette, at Lausanne. The main room of what his great-granddaughter called "an unassuming affair" had an exposed ceiling construction, and the decoration was confined to mural paintings of mountains, executed by the architect himself. The furniture was functional and simple. He died there in 1879.

Biography

Eugène Emmanuel Viollet-le-Duc. Born in Paris, 27 January 1814. Father was the keeper of Louis-Philippe's royal residences; uncle was the painter and scholar Etienne Delécluze. Educated at the Bourbon College until 1830. Married Elizabeth Tempier, 1834. Worked for the architect Jean-Marie Huvé, then for Achille LeClère, 1830–31; trips to southern France, Normandy, Loire and the Pyrenees, 1831–33; taught at the École de Dessin, 1834; travelled extensively in Italy in 1836; rejoined LeClère as auditor at the Conseil des Bâtiments Civils, 1838, and then as assistant at the Hôtel des Archives, Paris; employed as second inspector to the restoration of the Sainte-Chapelle, Paris, 1840; appointed chef du bureau of the Commission des Monuments Historiques, 1846; appointed inspector general of diocesan buildings, 1853; professor of art history and aesthetics, École des Beaux-Arts, Paris, 1863–64. Engaged in the restoration of French Gothic buildings, including Vézelay, Hôtel de Cluny, Notre Dame, Château de Pierrefonds, and Château d'Eu, from 1840.

Designed clock-cases, vases and lights in the mid-1830s, stained glass from the 1840s, and furniture and decorations from the 1850s. Published numerous books on architecture, archaeology and design from the late 1850s. Chevalier, 1849, Officier, 1858, and Commandeur, 1869, Légion d'Honneur; corresponding member of the Royal Institute of British Architects, London, 1855. Awarded Gold Medal, Royal Institute of British Architects, 1864. Died in Lausanne, 17 September 1879.

Selected Works

A large number of Viollet-le-Duc's drawings are in the École des Beaux-Arts, and the Fonds Viollet-le-Duc, Paris. About 250 preparatory drawings relating to his work at the Château d'Eu are in the Musée Louis-Philippe, Eu. Examples of some of his furniture are in the collection of Geneviève Viollet-le-Duc. For a complete list of his architectural projects and restorations see Foucart 1980.

Interiors

- 1840–59 Abbey of La Madeleine, Vézelay (restoration)
- 1845–64 Notre Dame, Paris (restoration)
- 1850–75 Cathedral, Amiens (restoration)
- 1855 Napoleon III's train, Compagnie des Chemins de Fer d'Orléans (decorations and furniture)
- 1857–58 Constant Troyon House and Studio, Paris (building and some interiors)
- 1857–70 Château de Pierrefonds, Oise (restoration, interior decoration and furnishings)
- 1860–61 Maison Milon, 15 rue de Douai, Paris (building and interiors)
- 1862–63 Viollet-le-Duc House, 68 rue Condorcet, Paris (building and interiors including decorations)
- 1864–66 Château de Roquetaillade, Mazères, Gironde (building and interiors; with Edmond Duthoit)
- 1874–78 Viollet-le-Duc house (La Vedette), Lausanne (building and interiors including decorations)
- 1874–79 Château d'Eu, Seine Maritime (restoration, interior decoration, furniture and outbuildings)

Vogue Regency

The phrase "Vogue Regency" was coined by Osbert Lancaster in *Homes, Sweet Homes*, (1939), to describe the sophisticated version of the Regency Revival which formed the most fashionable style of decorating in Britain between the wars. Alongside parallel Empire revivals in Europe and the United States, the English Regency was rediscovered by a small band of collectors and connoisseurs just before World War I, was popularised as a decorating style in the 1920s and 1930s, and remained an influence until well into the 1950s.

Regency-style furniture had been manufactured in the later 19th century by firms such as Wright & Mansfield and Edwards & Roberts as a part of the confused eclecticism of the Queen Anne Movement. Artists such as J. M. Whistler, Charles Ricketts and Charles Shannon collected authentic pieces, while designers like E. W. Godwin and George Walton made references to Regency forms in their work. During the reign of Edward VII, Regency and Empire styles were used by commercial decorators for hotels, liners and offices. At the same time, a close-knit group of collectors began more singlemindedly to create convincing Regency-style interiors.

The American-born playwright Edward Knoblock began collecting Empire furniture in 1912 to decorate his Paris apart-

Vogue Regency: dining room in 18th-century style from *Schemes in Antique Furnishing*, by H.P. Shapland, 1909

ment. (At the same time the Napoleonist Paul Marmottan was assembling in his Paris house, later a museum, a personal collection of Directoire and Empire furniture and objects.) Moving to London in 1914, Knoblock decorated his room in a sombre Regency manner and in 1917 attended the sale of the contents of Thomas Hope's house, The Deepdene, Surrey, where he acquired many of the finest examples of Hope's Greek Revival furniture. As a setting for his collection, Knoblock bought and imaginatively restored between 1918 and 1921 Beach House, Worthing, a villa of 1820, with Maxwell Ayrton as architect. Knoblock also made his London house, 11 Montague Place, into a showcase of the Hope style on a more modest scale. These widely-admired interiors were illustrated in *Country Life* and elsewhere and established the Regency Revival as a decorating style.

From these largely authentic historical recreations a belief developed, expressed by writers such as Christopher Hussey and Osbert Lancaster, that the Regency style had a special affinity with contemporary taste and that it could be successfully practised in a modern context. Accordingly, a series of houses in London and elsewhere was remodelled in the 1920s and 1930s in a style which, as Lancaster put it, began "where Soane left off". The architect Lord Gerald Wellesley turned his own London house, 11 Titchfield Terrace, into an essay in his

inventive "paste-pot" architecture; marble walls, fake pilasters and elaborate borders were made from cut-out marbled papers to form a background to a collection of Regency furniture and artefacts inspired by Wellesley's forebear, the 1st Duke of Wellington. At 17 Park Square East, London, remodelled by Wellesley for H.J. Venning, similar decoration was combined with Modernist wall paintings, while at the house of another architect, H.S. Goodhart-Rendel, at 13 Crawford Street, London, Regency furniture and decoration were offset by a very modern colour scheme of coffee and Wedgwood-blue and some almost Art Deco light fittings. This smart and rather daring style was carried to its extreme at the astonishing Mulberry House, Smith Square, London, a neo-Georgian Lutyens house remodelled by Darcy Bradell in the late 1920s with Grecian columns, jazz-modern murals by Glyn Philpot and a bronze relief by C.S. Jagger entitled *Scandal*: it was, as David Watkin has noted in *Thomas Hope and the Neo-Classical Idea* (1968), "the perfect setting for scenes in any one of Evelyn Waugh's early novels". Outside London, country houses were sometimes shorn of Victorian accretions and given a modish Regency look, as at Llysdyman, Powys, remodelled by Guy Elwes in 1934.

Osbert Lancaster's drawing of "Vogue Regency" shows the glossy, rather generalised Regency interior widely fashionable

by the later 1930s in which antique and reproduction furniture was sophisticatedly combined with modern furniture and fittings. This phase of the Regency Revival – the work of decorators rather than architects or collectors – was typified by the dealer-decorator Mrs. Harrington “Dolly” Mann and her partner Norris Wakefield. Mrs. Mann’s shop was noted for its Regency furniture, especially painted pieces, and her clients included Sir Henry Channon (whose London house at 5 Belgrave Square had a Regency Revival library designed by Gerald Wellesley) and Edward James, who used Regency and Empire furniture as a foil to his collections of Surrealist and modern works of art.

The quintessential example of Lancaster’s Vogue Regency was Norman Hartnell’s house, Lovel Dene, near Windsor, Berkshire, decorated by Norris Wakefield around 1935. Its rooms were painted in light but daring colours – lilac and turquoise blue – accompanied by a great deal of gilding and cut-glass in the form of crystal chandeliers and wall-lights. An extravagant Venetian looking-glass in the hall would become practically the hallmark of the style, while theatrical touches such as the swan motifs and gilded blackamoors (an example of which appears in Lancaster’s drawing) became decorators’ clichés after the war. The characteristic Regency and white-painted furniture was supplied by Mrs. Mann.

The interest in the early 19th century that was such an important aspect of taste between the wars also affected artist-designers such as Enid Marx (textiles), Edward Bawden (wallpapers) and Eric Ravilious (pottery and furniture). The house shared by Bawden and Ravilious from 1930, Brick House at Great Bardfield, Essex, became the progenitor of many post-war interiors in its wittily inventive use of wallpapers and textiles and delight in the minor arts of the 19th century. This taste was found to be compatible with the Contemporary style of the 1950s, and throughout this decade the magazine *House and Garden* under its editor Robert Harling championed a sophisticated blend of 19th century and modern that was in effect a continuation of Vogue Regency. The notable use of Regency stripe and spot pattern wallpaper as part of this style had been promoted by the 1945 Exhibition of Historic and British Wallpapers in London.

A late and brilliant expression of the theatrical aspect of the Regency Revival was given in the mid 1950s in the pastiche interiors created by the photographer Angus McBean in his Endell Street., London house, appropriately christened “Fourth Empire”.

Vouet, Simon 1590–1649

French painter and tapestry designer

Simon Vouet’s genesis as an artist is complex since he drew his inspiration from two cultures – French and Italian – and two styles of art – Mannerism and Baroque – yet succeeded in combining strengths from all. He was trained in the Mannerist tradition of the school of Fontainebleau, a refined and elegant style whose roots were in the imported Italian Mannerism of such artists such as Primaticcio, Nicolò dell’Abate and Bronzino. But as a young artist, Vouet seems to have been equally drawn to the very different style prevalent in Rome at the beginning of the 16th century, that of Caravaggio, with its strong shadows, earthy realism and heavy human forms. He spent over a decade in Rome, working in a manner that shows a strong awareness of the tenebrism of Caravaggio, yet which is never quite as brutally realistic as that of a true “Caravaggist”: like many artists, he seems to have retained a preference for a more classical elegance in his work, and is in fact closest to the classical spirit of the Bolognese artists working in Rome, such as Reni and Guercino. Indeed, one of his Roman works, *Sophonisba Takes the Poison Cup* was until recently thought to be by Guercino.

His very successful career in Rome was cut short by a summons from Louis XIII to return to France. Once there, his style, which was already showing a lessening of Caravaggist strength and an increasing tendency towards decorative flatness, developed in a way which indicates an extremely flexible artist succeeding in marrying two apparently incompatible styles. He responded to French taste by turning increasingly to cool colours, controlled line and elegance, yet with a volume and firmness of modelling derived from his Italian years.

That Vouet managed to please the conservative Paris taste may be seen from the success of his workshop there. He soon became the head of a large atelier, whose staff included many of his family members, including his wife, who gave drawing lessons, and his son-in-law, Michel Dorigny, who engraved most of his paintings and interior designs. His pupils included many who were to become great in the next generation, Eustache Le Sueur, Le Brun and Mignard. Vouet was commis-

sioned to paint altarpieces and secular subjects in equal quantity, as well as a large number of decorative schemes for the town houses of the aristocracy and wealthy courtiers in Paris. And as Premier Peintre du Roi, he was also responsible for many royal commissions, executing decorative painting for Marie de' Medici, Louis XIII and his sister Henrietta Maria, at the Luxembourg Palace, and a series of bold grotesque decorations at the Palais Royal for Anne of Austria (1645). In addition, he designed many important suites of tapestries including *Rinaldo and Armida* (12 pieces), *Scenes from the Old Testament* (8 pieces), *Scenes from the Odyssey* (8 pieces), and the *Loves of the Gods* (23 pieces). Unfortunately our knowledge of Vouet's domestic designs is sadly lacking, since none of his decorative schemes in France has survived, and almost nothing is known of them beyond Dorigny's engravings and a small number of individual canvases which remain. Viewed out of their context they are a poor indication of the schemes which made Vouet famous.

The only scheme which does survive is an early one from his Rome years, the Alaleoni chapel in the church of S. Lorenzo in Lucina in Rome. The arrangement here is, as far as we can deduce from the fragmentary survivals, standard for many of Vouet's schemes in France. He used a combination of oil canvases and fresco decoration around them, often placing canvases on the walls with a frescoed ceiling. While the canvases are, particularly in the case of S. Lorenzo in Lucina, straightforwardly Baroque in character, the decoration is largely Mannerist, both in detail and in spirit. It includes grotesques and masques, rams' heads and strapwork which could have come straight from the palace of Fontainebleau. Even more reminiscent of Fontainebleau is the frequent inclusion of stucco figures, usually the work of his pupil, Jacques Sarazin.

In one aspect in particular, all Vouet's decorative work shows a hesitancy over the more overwhelming aspects of Baroque art, a hesitancy which has often been seen to reflect a national tendency in French art towards the rational and the classical. Although the majority of examples of unified illusionism, such as the ceilings of the Barberini palace or the Gesù, date from after Vouet's departure from Italy, he would have been aware of the illusionist experiments and daring of Correggio, Lanfranco, and of Guercino in the Casa Ludovisi. Yet the approach he took is the conservative one of the 16th century where scenes which, despite individual illusions of perspective, always remain discrete, and are set into an elaborate ground of decoration that emphasises the real surface of the ceiling. There is no attempt in Vouet's work to fool the spectator into thinking of the ceiling above his head as one continuous and infinite space. In this he often seems to be following a Venetian model, such as Veronese's work in the Doge's Palace, which he would have known, since he had stopped in Venice for some time on his return to France. He frequently borrowed heavily from Veronese, as in *Prudence, Peace and Abundance*, done for the Palais Cardinal on a commission from Richelieu, and now in the Louvre.

The only cautious deviation from this conservatism is the chapel at the Hôtel Séguier, known from Dorigny's engravings, which shows the Adoration of the Magi. The procession of the Magi and attendants parade around the ceiling as if standing on the top of the walls, an illusion increased by the use of a

balustrade which pushes the figures into a firmly defined, yet limited space.

Vouet's achievement was to bring back to the jaded Mannerism that was French art a vitality, a fine but tempered version of Roman and Bolognese Baroque art. Although his decorative schemes are the aspect of his art which we can know least well today, they seem to have been the means through which this new style was best communicated, a legacy of enormous importance for artists of the next generation in France.

CHANTAL BROTHERTON-RATCLIFFE

Biography

Born in Paris; baptized 9 January 1590; the son of Laurent Vouet, a master painter. Trained with his father, 1597–c.1604. Lived in London, c.1604–08, returning to Paris, c.1608; in Constantinople, 1611–12, and stayed in Venice on his return, 1612–13; moved to Rome, 1613–14, lodging with the French sculptor Christophe Cochet. Received a royal pension from Marie de' Medici from 1615. His brother Aubin (1599–1641), Peintre Ordinaire du Roi, joined him in Rome, 1620; moved to Genoa, in service of Don Paolo Orsini and Doria family, 1621–22; returned to Rome, 1622. Worked on several church commissions in Genoa, Rome, and Naples, 1622–24, and undertook commissions for Pope Urban VIII, Cardinal Francesco Barberini, and Cassiano dal Pozzo. Married 1) Virginia da Vezzo (or Vezzi), 1626 (died 1638): 5 children; 2) Radegonde Béranger, 1640: 3 children. Returned to Paris via Venice, 1627; became Premier Peintre du Roi, with annual salary; worked on royal commissions at the Louvre, St. Germain-en-Laye, and the Luxembourg Palace, for Louis XIII, Queen Henrietta Maria and Charles I. Executed many decorative commissions for the Parisian hôtels of the *noblesse de robe* and financiers. Also important tapestry designer of secular and sacred subjects, based on his painted cycles. Toward the end of his career active for Queen Regent, Anne of Austria at the Palais Royal. "Prince" of the Academy of St. Luke, Rome, 1624, and the French Academy of St. Luke. Suffered a stroke, 1648; died in Paris, 20 June 1649.

Selected Works

Substantial collections of Vouet's drawings are preserved at the Louvre, Paris, the Musée des Beaux-Arts, Besançon and in the Graphische Sammlung, Munich.

- 1630–31 Château de Chilly (vault of the gallery): Antoine Coiffier, Marquis d'Effiat
- 1634–35 Hôtel de Bullion, Paris (gallery, Grand Cabinet, Petit Cabinet scenes from the *Story of Ulysses*): Claude de Bullion
- 1634–35 Hôtel Séguier, Paris (ceiling frescoes in Upper and Lower galleries, chapel): Chancellor Séguier
- 1636–38 St. Germain-en-Laye (ceiling paintings): Louis XIII
- 1645 Palais Royal, Paris (grotesque decoration in Cabinet des Bains, Chambre de Parade, Chambre de la Reine, Petite Galerie de la Reine): Queen Regent, Anne of Austria
- 1647–48 Château de Colombes (Chambre à l'alcôve, with Michel Dorigny): Pierre Le Camus

Voysey, C.F.A. 1857-1941

British architect and designer

In the 1930s, still within his own lifetime, C.F.A. Voysey began to be hailed as a pioneer of Modernism. Elements were taken from his architecture and interior design such as the lack of added ornament, the low horizontal emphasis of his buildings, the simple treatment of interior surfaces using plain white walls and natural wood, and claimed as Modernist. His

emphasis on the search for peace and harmony through the simple treatment of the home was also in line with Modernist thought.

Voysey was not pleased with these accolades, seeing himself as firmly within the Arts and Crafts camp. Certainly there were Modernist ingredients in Voysey's writings and practice, but they were only part of a broader holistic approach to design, and to single them out for special attention produced a distortion of the understanding of his work and historical position. Voysey was actively involved with Arts and Crafts organisations such as the Art-Workers' Guild and the Arts and Crafts Exhibition Society. Articles appeared in decorative art magazines such as *The Studio* and the German *Dekorative Kunst* in the 1890s setting out his design philosophy alongside examples of his architecture and pattern designs. The centrality of religious thought to his design practice is evident. He saw God as the creator of the natural world which formed the source for his pattern designs. He believed that the symbols of simple natural form such as birds and plants could exert a good influence on the viewer and thereby influence society as a whole. He stated that colours should be "bright and cheerful", not "mud and mourning". Birds appeared frequently in his pattern designs for textiles and wallpaper but always as conventional rather than realistic design. By conventional Voysey meant flattened and stylised, for it was his view that in a fitting wallpaper a realistic looking bird with its head chopped off would have a brutalising effect on the viewer.

Voysey's own house, The Orchard, Chorleywood (1899), was the first of a number of projects in which he controlled every aspect of the design, including the interior surfaces, textiles, wallpaper, carpets, movable furniture and even the ventilator grilles. It was widely publicised in Britain and abroad. There was a balance of plain white surfaces, natural wood, plain tiles and richly coloured textiles, carpets and wallpapers. An illustration of the hall c.1900 shows a white painted vertical slatted screen by the staircase which linked the upper and lower floors. The cottage-style planked door with its hinges forming a functional but decorative feature is typical of Voysey and of Arts and Crafts practice. The picture rail was low and unmoulded so as not to trap dust. The frieze above the picture rail and the ceiling were painted white to reflect the light. The fireplace had plain green tiles. These were elements which appeared frequently in the interiors of Voysey houses. He often used vertical boarded oak panelling as a wall treatment where more money was available, for example, in the dining room which he remodelled in Birkenhead for A.H. Van Gruisen (1902). A more unusual choice of wall surface for Voysey was unpolished green slate which he used in large slabs in a room for the interior re-modelling of Garden Corner, Chelsea Embankment for E.J. Horniman (1906-07). He was given a free hand and a large budget for the latter project in which he lowered ceilings and replaced doors, windows and fireplaces. He designed all of the furniture and fittings with the exception of some of the pendant light shades which were designed by C.R. Ashbee.

In addition to his architectural practice, Voysey was a widely known and highly successful freelance designer for all the leading textile and wallpaper companies by the mid-1890s. Although he did make use of some handcrafted textiles or carpets for some commissions, he frequently used his own

Voysey: interior of bedroom, *The Orchard*, Chorleywood, 1899

mass-produced designs. His work with commercial manufacturers, as well as providing much needed income, enabled him to fulfil his desire to extend the range of his designs beyond the wealthy individual client. This was a desire shared by other Arts and Crafts designers such as A.H. Mackmurdo, Walter Crane and L.F. Day in the 1880s. Voysey's metal fittings such as door and window handles, ventilator grilles and fireplace furniture (often with a bird or heart motif) were manufactured by Elsley and Co. for general retail sale. In theory it was possible, therefore, to construct a Voysey interior from readily available retailed items by the late 1890s when his work was widely publicised in the design press and in women's magazines.

For furniture, Voysey preferred plain, unvarnished oak or deal in simple designs which were made for him by a small number of craftsman firms. He favoured the Arts and Crafts practice of using wooden pegs and glued joints or decorative brass strap hinges. The heart motif, which often formed a linking element in his interior schemes, frequently appeared as a cut out from the back panel of a chair or in brass hinges. Some examples of upholstered furniture using his own textile designs exist, for example, a high-backed chair at Wightwick Manor, but these are less typical of his work. From 1896 much of Voysey's furniture was made by Arthur Simpson of Kendal for whom Voysey designed a house, Littleholm, in 1909. By this stage in his practice Voysey was often specifying the interior furnishings on his plans. Simpson's granddaughter recalled that Voysey had specified red curtains for the dining room. Some years later when Voysey visited he discovered that they had been replaced by blue and a row ensued with Mrs. Simpson who was accused of ruining his design. For subse-

quent visits the red ones were rehung. Other evidence exists to suggest that Voysey was committed to a total design concept, for example, when constructing Gordondene in 1901 for a barrister, Cecil Fitch, he was distressed and shocked that his client had substituted an "appallingly ugly and gaudy" lavatory and bath for the simple one that he had designed with "beautiful clean oak casing".

Voysey's ideas and the totality of his practice place him firmly within the second phase of the Arts and Crafts movement from the 1880s when many designers were collaborating with manufacturers to extend the availability of their work. Elements of his writing and design practice led him to be influential in the development of Modernism both in Britain and on the Continent.

Biography

Charles Francis Annesley Voysey. Born in Hessle, Humberside, 28 May 1857. Attended Dulwich College then educated by private tutor. Married Mary Maria Evans, 1885; son was the architect Cowles Voysey. Articled to the Gothic Revivalist architect John Pollard Seddon (1827–1906) from 1873; assistant to Henry Saxon Snell (1830–1904), 1879; worked as an "improver" in the office of George Devey (1820–86), 1880–82. Active in independent practice as an architect, London, 1881–1914; designed wallpapers and textiles from 1883 until the 1930s; active as a furniture designer from c.1895. Member of the Art-Workers' Guild from 1884, elected Master, 1924; made a Designer for Industry by Royal Society of Arts, London, 1936; Royal Gold Medallist, Royal Institute of British Architects,

1940. Exhibited at numerous national and international exhibitions including the Arts and Crafts Exhibitions, London, from 1888, Paris 1900, and Turin 1902. Died in Winchester, 12 February 1941.

Selected Works

Large collections of Voysey's architectural drawings and decorative designs are held in the Drawings Collection of the Royal Institute of British Architects, and the Department of Prints and Drawings, Victoria and Albert Museum, London. Examples of his textiles and wallpapers are in the Victoria and Albert Museum, London, and in the Whitworth Art Gallery, Manchester; examples of his furniture are in the Art Gallery and Museum, Cheltenham. The majority of Voysey's interiors were custom-made for buildings also to his design; archive photographs of many of these projects are in the Photographs Collection, Royal Institute of British Architects, London.

Vredeman de Vries, Hans 1527-1606(?)

Netherlandish painter, architect and *ornemaniste*

Hans Vredeman de Vries was a Netherlandish architect, designer and painter, known above all for a collection of engravings that served to popularise a strongly architectural style of ornament and decoration based on variations of the classical "orders". These engravings had considerable influence, not only in his native country but also in Germany and Eastern Europe and especially in England where they were closely associated with the development of the Jacobean style.

Vredeman de Vries: engraving from *Perspective*, 1604–05

Vredeman was born in 1527 in Leeuwarden in Friesland and trained first under the glass painter Reyer Gerrits who was also active in Amsterdam and Dordrecht. In 1549 Vredeman was recorded as working under Pieter Coeck (1502–50) on the elaborate strapwork decorations for the triumphal entry of Charles V into Antwerp; he settled in Antwerp in 1561 and in 1570 worked in collaboration with Antonis Mor on the Great Triumphal Arch for the visit of Anne of Austria.

Several paintings, either wholly or partly by Vredeman, have survived. These include *Christ with Mary and Martha* (1566, Hampton Court, near London) where the figures might be by Abraham Blocklandt, and the *Renaissance Palace with Lazarus* (c.1600, Rijksmuseum, Amsterdam). Carel van Mander, writing in 1604, praised the illusionistic architecture in Vredeman's work and mentioned in particular two paintings with *trompe-l'oeil* perspectives done for the church of St. Peter in Hamburg. In the preface to his final publication, *Perspectiva* (1604), Vredeman claimed to be something of an expert on this subject. He declared that he had written nine books on

perspective and his paintings helped to create a whole new genre of elaborate architectural views, mainly interiors.

Vredeman spent much of his life travelling, and he is recorded as working at Aachen, Braunschweig, Prague, Wolfenbüttel, Frankfurt and Danzig (Gdansk) where, according to van Mander, he painted a series of Allegories for the City Council. His architectural work began under the direction of Cornelis Floris (1514–75) at the Hôtel de Ville in Antwerp (1561–66) but was cut short by the fall of the city to the Duke of Alba in 1567 and the subsequent Spanish Fury. Nevertheless, Vredeman had already discovered the work of Vitruvius and Sebastiano Serlio and had begun to publish the ornamental designs for which he became famed.

His designs were derived largely from the example of earlier Northern sculptors and stonemasons such as Coeck and Floris and in a sense Vredeman's prints were no more than copies or vulgarisations of their work. Yet their sheer number and accessibility made them very popular, and with the publication of his *Artis perspektivae plurium generum ...*, (1568) and his *Architectura* (first printed in 1577 and reissued four times),

Vredeman made available to a far larger audience a form of classicism that could be used easily for all kinds of decoration. The engravings were of a variety of ornament including grotesques, vases, caryatids and scrolls, and were adapted for interior decoration, furniture and even tapestries, as is demonstrated by the suite of hangings woven for the Earl of Leicester at the end of the 16th century. There was much emphasis upon the classical orders and also strapwork – a type of patterning that could be laid across both flat and curved surfaces and for which Vredeman was well-known. Indeed, Vredeman's work seems to be the source for the patterns used by the English architect Robert Smythson for the Hall screen at Wollaton (1580–88) which were taken from his publication *Scenographiae* (1560, 1563, enlarged as *Variae Architecturae Formae*, 1601). And the tomb of the first Countess of Devonshire, at the church in the park at Hardwick, designed by John Smythson in 1627, appears to be an adaptation of a drawing which is itself a copy of a design in the same volume by Vredeman.

But perhaps the most striking and influential of Vredeman's designs were those for scrolled gables, a form of architectural roof decoration very popular in England and the Netherlands during the 16th century. The patterns followed the necessary slope of the outlines of the gables, with C-scrolls and S-scrolls on the stone trimming on buildings that were often built of brick. And this ornament could also be used on the smaller interior gables within those that flanked them. This kind of design had perhaps originated in Italy in the work of Brunelleschi and then Alberti on the façade of S. Maria Novella, Florence. But when the first scrolled gable appeared in Northern Europe in 1540, in a design by Alessandro Pasqualini at the court of the Kasteel at Buren, it was close enough to the type of scrolled gables already apparent in the Netherlands since the 1530s to suggest that a process of cross-fertilisation between North and South was taking place. Northern European examples included the Paalhuis, Amsterdam (1560), Floris's Hôtel de Ville, Antwerp, Hans van Paschen's Kronborg Slot in Helsingør, Denmark (1574) and details of Anthonis van Opbergen's Wiezienna Tower (1587) and his Arsenal (1602), both in Gdańsk. The same gable designs were also visible in England at Kirkby Hall, Northamptonshire (1575–83) and on the roof line at Wollaton. By this date, however, Vredeman's influence was complemented by the engravings of Wendel Dietterlin that made up his *Architectura* (1593) and which were in a brilliantly extreme three-dimensional version of the strapwork-grotesque style. And with the passing of the artisan Mannerist style, exemplified by the Dutch gable, there was no need to refer either to Vredeman, or to the German "Ditterling"; the model now was to be that of the more directly Italianate architecture of Inigo Jones and John Webb.

Biography

Born in Leeuwarden, Friesland, in 1527. Apprenticed for five years to a glass painter before moving to Kollum to work for a cabinet-maker. Worked on the decorations for the entry of Charles V and Philip II, Antwerp, 1549. Active as a painter in Mecheln; settled in Antwerp c.1561. Married 1) Johanna van Muysen; 2) Sara van der Elsmaer, 1566: son was the painter and designer Paul Vredeman de Vries (b.1567). Published numerous suites of ornament, including strapwork cartouches and grotesques, from 1555. Left Antwerp, 1570, but returned to work as an architect and designer, 1575–86. Active in several cities in the Low Countries, and the Empire: worked as a gardener, architect, painter and designer in the service of Duke Julius in Wolfenbüttel, 1587–89; active in Hamburg and Danzig; worked for the Emperor Rudolf II in Prague as a painter and designer, 1596–98. Died in Antwerp(?), 1606(?).

Wagner, Otto 1841–1918

Austrian architect and designer

Otto Wagner was a leading architect of the Vienna Secession whose stark functionalist furniture has also led to his being described as an early pioneer of the 20th century Modern Movement. Born in Penzig, a village near Vienna and close to the Schloss Schönbrunn, he was the son of a notary at the Royal Hungarian Court. Despite his father's death when Wagner was aged five, he was privately educated before attending the Akademisches Gymnasium in Vienna and the Benedictine Boarding School at Kremsmünster, in preparation for a career as a lawyer. At an early age he determined to follow his godfather's profession as an architect. His academic success at the Vienna Technical High School (1857–59) enabled him to avoid military service, and he proceeded instead to the Imperial Building Academy, Berlin (1860–61), and then returned to Vienna where he completed his education in 1863 at the Academy of Fine Arts under Eduard van der Nüll and August Sicard von Sicardsburg. He won his first architectural competition for a casino in the Vienna City Park later in the same year.

A man of enormous energy and diligence, Wagner worked ceaselessly for the next fifty years, entering competitions, designing buildings, public works, and furniture – work that paved the way for new developments in architecture and interior design. His achievements culminated in his two masterpieces; the church of Am Steinhof and the Postal Savings Bank in Vienna.

Much of his early work – both buildings and furniture – was firmly rooted in the currently fashionable “eclectic” style and was inspired by Renaissance or Neo-Classical models, yet even at this stage of his career a move towards simplicity of form and reduction of ornament is discernible. For example, the exterior of the first Villa Wagner at 26 Hüttelbergstrasse (1886–88) was solidly classical in form, the central block having a Greek-columned portico flanked by two pergolas. By 1900, one pergola had been converted into a studio incorporating dramatic stained glass (*Autumn Landscape in the Wienerwald* by Adolf Böhan) within a chaste interior whose painted decoration parallels the work of Victor Horta in Brussels.

By 1896, Wagner had refined his architectural and design

credo, laying down the four principles on which his work would continue to be based. These were: first, a precise understanding of the purpose of the object or building down to the smallest detail; second, the auspicious (*glücklich*) choice of materials which should be readily available, solid, economical and easy to work; third, simple and economical construction; all of which meant that, fourth, form would be practical and easy to comprehend.

These principles first appear in many of his public works; for instance, his railway stations for the Stadtbahn and the Kaiserbad Dam where his use of materials such as corrugated zinc, copper sheet, aluminium, prefabricated concrete and marble cladding is both innovative and practical. Similarly expedient features were incorporated in the apartment house at 38–40 Linke Wienzeile (1898–99) which had severe lintelless windows and a façade of terracotta maiolica red floral design that was intended to aid cleaning by the Fire Brigade!

This same attention to detail is amply demonstrated in the St. Leopold's Church (Am Steinhof) at the Lower Austrian State Sanatorium and Institution (1905–07). The church, which dominated the sloping hillside site, is of brick construction protected by 2 cm. thick sheets of marble fixed by bolts with screw copperheads; indeed all the exposed metal surfaces are copper-coated. The plan is a modified Greek cross with a single-span central block with slight projections, and the building is flooded with light from Koloman Moser's stained-glass windows. The major consideration in the design of the interior – every detail of which was devised by Wagner or one of his associates – was hygiene, and accordingly the walls were clad in marble to allow for easy cleaning, confessionals dispensed with the traditional dust-collecting curtains, and the dominant colour was white. The rear section was left empty to allow space for patients in wheelchairs and the four-seater pews in other areas enabled easy access to inmates requiring attention during services. Both presbytery and altar are raised while the nave floor slopes down towards the altar to aid visibility. Instead of frescoes, the pictures above the altar were executed in mosaic by Remigius Greyling and Rudolf Jeltman. Wagner himself designed the Mass vestments, chalices, light fixtures and many of the ceremonial items.

Wagner's contribution to secular design is best demonstrated in his work for the Postal Savings Bank which was constructed in two stages in 1904–06 and 1910–12. Once again the walls are faced in marble held in place with

aluminium bolts, the same metal being used in the interior for the cylindrical hot air blowers in the main banking hall where chaste pillars support the dramatic glass roof above a suspended glass ceiling. The whole interior and its furnishings were designed for durability, ease of maintenance, and economy. Walls in the public areas are clad in marble or glass, writing surfaces are covered with hard rubber, the floor is covered with linoleum and aluminium is used for functional decorative detailing. The office areas feature adjustable partitions for flexibility. Standardised furniture, suitable for easy storage, was based on the bent-wood techniques developed by the Thonet Company. Variety was achieved by the use of different materials, the choice of which was determined by where the furniture was to be placed within the building and by whom it was to be used. Senior officials had pieces made of tabasca mahogany with brass mouldings and red textile upholstery, while red beech, aluminium mouldings and grey textiles were used for items for other administrative areas and public spaces. The stools with perforated plywood seats in the main hall represent the culmination of Wagner's quest for simplicity of form combined with ease of production and practicality.

In addition to his design and architectural work, Wagner occupied the Chair of Architecture at the Vienna Academy of Fine Arts from 1894; his pupils included Josef Hoffmann and J.M. Olbrich. He was also closely associated with the Vienna Secession from 1899 but he resigned in 1905 along with Gustav Klimt and others. He remained active as an architect until 1912, and continued to design furniture, wallpapers, textiles, metalwork and jewellery up to his death in 1918.

BRIAN J. R. BLENCH

Biography

Born in Penzig, near Vienna, 1841, the son of a wealthy bureaucrat. Attended the Technische Hochschule, Vienna, 1857–59; enrolled at the Bauakademie, Berlin, 1860–61; studied under Eduard van der Nüll and August Sicard von Sicardsburg at the Academy of Fine Arts, Vienna, 1861–63. Married 1) Josefine Dornhart, 1863 (divorced 1880); 2) Louise Wagner (died 1915): 3 children. Employed by the architect Ludwig von Forster, 1863; active in independent practice, Vienna, from the late 1860s; designed furniture and interiors from the mid-1870s; drawing office employed about 70 collaborators including Josef Hoffmann, Jože Plečnik, Max Fabiani, Leopold Bauer, and, as chief draughtsman, Joseph Maria Olbrich, from the mid-1890s. Appointed artistic adviser to the Vienna Transport Commission to supervise the design and building of a new rail and canal transit system, 1894. Chair, and professor of architecture, Academy of Fine Arts, Vienna, from 1894; pupils included Hoffmann and Olbrich. Member, Vienna Secession, 1899, and Deutscher Werkbund. Published several influential works including *Moderne Architektur*, 1895. Exhibited at several national and international exhibitions including Jubilee Exhibition, Vienna, 1898, Paris, 1900, and Turin, 1902. Died in Vienna, 1918.

Selected Works

A large collection of Wagner's drawings and designs for architecture, decoration and furniture, is in the Academy of Fine Arts, Vienna; additional drawings and designs for textiles are in the Archive of Johann Backhausen & Sohne, Vienna. Numerous examples of Wagner's furniture are in the Historisches Museum, Vienna; much of his original furniture, fittings and decoration also survives *in situ* in the Postal Savings Bank Office, Vienna.

Interiors

- 1877 Apartment House, 23 Schottenring, Vienna (building and some interiors)
- 1882–83 Apartment House, 6–8 Stadiongrasse, Vienna (building, interiors, decoration and furniture)
- 1886–88 First Villa Wagner, 26 Hüttelbergstrasse, Vienna (building, interiors and furniture)
- 1888–90 Palais Wagner, 3 Renweg, Vienna (building, interiors and furniture)
- 1894–1901 Stadtbahn System, Vienna (station and pavilion buildings, decoration and interior fittings; Karlsplatz Station with J.M. Olbrich)
- 1898 Jubilee Exhibition, Vienna (schlafzimmer, speisezimmer and bathroom)
- 1898–99 Apartment Houses, 38–40 Linke Wienzeile, Vienna (buildings and interior fittings)
- 1902 *Die Zeit* Telegraph Office, Vienna (new façade and interiors)
- 1904–06 Postal Savings Bank, Vienna (building, interiors and furniture; first and second stages)
- 1905–07 St. Leopold's Church, Am Steinhof, Vienna (building, interiors and furniture)
- 1912 Apartment House, 4 Döblergasse, Vienna (building, interiors and furniture)
- 1912–13 Second Villa Wagner, 26 Hüttelbergstrasse, Vienna (building, interior and furniture)

Wagner also designed furniture, wallpapers and textiles, decorations, metalwork and jewellery.

Wailly, Charles de 1730–1798

French architect, decorator and designer of ornament

Charles de Wailly was one of the most innovative architects at work in Paris in the second half of the 18th century. He was also a dazzlingly skillful draughtsman who raised the art of architectural rendering, especially the delineation of interiors, to new levels of expressiveness, earning for himself the rare title of *peintre-architecte*. He wove together numerous strands of artistic influence, old and new, enriching the repertory of Neo-Classical decorative motifs then in circulation, and introducing novel patterns of spatial organization. In his finest interiors, spaces open dramatically into spaces above and beyond, the eye is almost overwhelmed by mirrored reflections, and light glints off highly ornamented, multi-colored surfaces. All is controlled, however, by an inner structural logic; de Wailly's design sensibility was eclectic but deeply informed by the logic of Classicism.

Thanks to wealthy patrons and powerful friends in official positions, and to his own skills in self-promotion through the selective exhibition of drawings and the publication of prints after his most important inventions, de Wailly received major commissions during the 1760s and 1770s that established his Europe-wide reputation. He created some of the most innovative Paris interiors of the day and furnished provincial aristocrats and far-flung princely courts with sumptuous and learned designs redolent of high Parisian taste. Even after his own exuberant brand of Neo-Classicism had somewhat fallen from favor in the more chaste and soberly "archaic" Paris of the 1780s and 1790s, de Wailly continued to win commissions abroad, including Belgium, Germany and Russia, and to exert an influence on foreign architects, many of them his students. He was, says Kalnein, "one of the major conduits for the spread of Neo-Classicism across Europe" (Kalnein, 1995).

Born in Paris in 1730, de Wailly first studied architecture under Le Geay and Blondel. In 1752 he won the Prix de Rome but split the prize with his friend Pierre-Louis Moreau-Desproux, the two travelling together to Rome in 1754. It was there during 18 months of intensive study that de Wailly forged his style. He poured over the architecture of antiquity, drawing the Baths of Caracalla and Hadrian's Villa in the company of Moreau-Desproux and a future partner, Marie-Joseph Peyre. With their intricate interlocking chambers and, especially at Hadrian's Villa, scintillating integration of interior and exterior spaces, such monuments of Imperial Rome gave direction and the weight of impeccable precedent to many of de Wailly's later designs. At the same time and with equal attention, the young architect studied the monuments of modern Rome such as Bernini's Cathedral of Saint Peter at Saint Peter's. His admiration for the Roman Baroque, especially its play of light and shadow and exuberant deployment of varied materials, was exceptional for a French architect of the day and remained a lifelong inspiration. Like several talented, youthful compatriots at the Académie de France, de Wailly also fell under the sway of G.B. Piranesi, emulating the Italian printmaker's imaginative manipulation of decorative forms, and his pictorial evocation of enigmatic spaces.

Returning to Paris late in 1756, de Wailly worked for Servandoni on opera stage decor, as well as on the construction

of Ange-Jacques Gabriel's Opéra de Versailles, with its sumptuous gilded decorations by Augustin Pajou. Such experiences taught him how to imbue interiors with theatrical complexity and incorporate rich decoration into strongly articulated spaces. Success came quickly. Given important responsibilities at Versailles and Choisy, he also attracted the patronage and protection of the Marquis de Marigny, Superintendent of Royal Buildings. In 1767, Marigny named de Wailly to the first class of the Royal Academy of Architecture and then in 1771, in the face of intense opposition, appointed him to the Royal Academy of Painting and Sculpture as well, the first architect to be so honored.

Early on de Wailly exhibited an interest in furniture design and ornament, publishing a small portfolio of etchings in 1760 entitled *Première suite de Vases* (of which the only known copy is at the Musée des Arts Décoratifs, Paris). It includes robust, geometric vases decorated with grotesques and foliage that owe a debt to the ornamental designs of de Wailly's friend, William Chambers. It also includes innovative tables that evoke Mazarin desks of the 17th century, featuring exuberant, if spindly, legs. In the latter engravings, the vases are shown a second time, atop the tables, indicating that, like Piranesi, de Wailly thought in terms of decorative ensembles. At the Salon of 1761 de Wailly exhibited furniture, now lost, that likely related to the prints of the previous year, including an ornate table of lapis lazuli, executed by Pierre Garnier, and a granite vase in the antique style.

De Wailly soon had the opportunity to realize his decorative ambitions on a grander scale. Between 1762 and 1770, he renovated the Paris hôtel of the Marquis de Voyer. A delicate Rococo confection by Germain Boffrand, de Wailly transformed it, inside and out, into a richly decorated manifesto of the emerging Neo-Classical taste. He incorporated the Greek Ionic order on the garden façade, seemingly based on the Erechtheion in Athens, and a barrel-vaulted, coffered vestibule leading from the street. On the interior, confronting mirrors flanked by caryatids reflected an ornate decor of martial motifs on walls, and carved and gilded ceilings. Much commented on at the time, but destroyed in the 1920s, the house is known through sketches by Chambers, now at the Royal Institute of British Architects, London.

Other private commissions followed, of which the most important was the Château of Montmusard at Dijon, commissioned in 1764 by Jean-Philippe Fyot, Marquis de la Marche. Here, the façade was a convex, semi-circular colonnade fronting a circular terrace. Conceived as a Temple of Apollo, the terrace mirrored an enclosed circular salon beyond, styled as a Temple of the Muses, which projected into the garden. The other rooms of the house were tightly and symmetrically grouped around the two circular spaces. The château's distinctive ground plan owes a debt, as Braham has argued, to the organization of Roman baths and for the first time introduced an ancient spatial pattern as the shaping presence in a modern building. Work was never completed, but in later years de Wailly returned to the conceit of the temple-house, and to open and enclosed spaces that mirror one another, designing a Temple of Minerva (1772) for Catherine the Great, and a Temple of Diana for the Landgrave Frederick II of Hesse, the third design for which (1785) was the architect's most elaborate variation on the theme.

Other domestic projects evince equal inventiveness. In 1776–78 de Wailly designed adjacent houses on the rue de la Pépinière (1776–78) one for Augustin Pajou and the second for himself. The latter, surely one of the most original houses to rise in Paris in the late 18th century, was built around a circular double staircase, surrounded by columns, that began out-of-doors in a courtyard visible from the street and rose into the heart of the house. Illuminated by a lantern jutting from the roof, the staircase was flanked at each level by ingeniously grouped rooms and belvederes. Similarly, in 1774 de Wailly designed a house for Voltaire on the rue de Richelieu featuring a seemingly free-floating oval staircase at the heart of the house which was much admired at the time. His range of historical references was wide. In the crypt of the Paris church of Saint-Leu-Saint-Gilles (c.1780) he introduced the baseless Doric order to French architecture, and with the Chapel of the Virgin (1778) and extravagant pulpit (1789) for the church of Saint-Sulpice, he revealed a continuing debt to Bernini. A project of 1781–82 for the Château of Enghien in Belgium incorporates Gothic detailing.

In 1767 de Wailly received the most important commission of his career when he and Peyre were invited to design a new theatre in the heart of Paris for the Comédie-Française. The project required years of study, planning and revision – and the advice of Voltaire himself – the site was changed, the architects briefly were replaced, work began only in 1769 and the doors did not open until 1782. The theatre, whose name was changed in 1795 to the Odéon, is an austere rectangular box fronted by a colonnade of the Tuscan order that gives to it the air of an ancient temple. It dominates a semi-circular square from which streets radiate that is also the work of Peyre and de Wailly. If the former architect's sober taste dominates the exterior, de Wailly made his mark on the interior, now much altered. The auditorium was almost circular which allowed good sightlines for an audience intent on observing itself as much as the stage. As a series of marvelously expressive drawings attest – one showing an audience in Roman dress! – de Wailly created a masterpiece in the design of the public areas leading to the auditorium, for here twin colonnaded staircases link the vestibule, foyer and auditorium in a single, compelling spatial sequence that moves both horizontally and vertically. It set a standard for theatrical design that would be matched only a century later with Charles Garnier's grand theatricalization of the theatre at the Opéra de Paris.

In 1771, as he worked on the Odéon project, de Wailly travelled to Italy to study advances in theatre design. There he met the Marquis Cristoforo Spinola, Genoese ambassador to Versailles, who commissioned the most spectacular interior of the architect's career, the redecoration of the "salone" of the Palazzo Spinola in Genoa, which the architect carried out in 1772–73. Twenty fluted and gilded Corinthian columns lined the vast room, framing round-headed windows on two sides and forming the support for Serlian arches on the others. Set into the Serliana were large mirrors in which the sumptuous decor was reflected over and again. Surfaces were decorated with carvings and gilt, and the light of giant chandeliers glinted off luxurious materials such as lapis lazuli plaquettes. A boldly sculptural cornice supported a clerestory with *oeil-de-boeuf* windows that rose to an oval, illusionistically-painted ceiling. Here all the themes of de Wailly's interior design career came

together; Baroque grandeur, the almost hypnotic visual overload of Piranesian imagery, an erudite use of architectural motifs, and the expansiveness of contemporary stage sets. The *salone* quickly became famous in Paris owing to the gloriously atmospheric drawings that de Wailly exhibited at the Salon of 1773, surely the most technically audacious architectural renderings of the century, and to the engravings of the project that he published in the *Encyclopédie* in 1777.

By the time of the Revolution in 1789, de Wailly's expansive, elegant brand of Neo-Classicism, so appealing to aristocratic taste in earlier decades, had fallen from favor. Sympathetic to reform, he served on various Revolutionary committees concerning the arts and indeed put his architectural skills to the service of good government, proposing in 1793 to transform a former Jesuit church in Brussels into an austere, egalitarian meeting hall for the Friends of Liberty and Equality, never realized. He died in his apartment at the Louvre in 1798. Extravagantly admired during much of his lifetime and now recognized as a major figure in 18th-century architecture, de Wailly is remembered for his brilliant ability to orchestrate complex spaces into dramatic, sweeping symphonies of structure, color and light, and for the effortless erudition with which he manipulated the vast possibilities that the history of architecture and design, which he knew so well, generously laid before him.

CHRISTOPHER RIOPELLE

Biography

Born in Paris, 9 November 1730. Studied architecture under Jacques-François Blondel (1705–74), Giovanni Nicolo Servandoni, and Jean Laurent Le Geay (fl.1710–86). Awarded Prix d'Architecture de Rome, 1752; studied at the French Academy in Rome where he met William Chambers, 1754–56. Returned to Paris, 1756 and worked for Servandoni on stage decoration; also active as a decorator, architect and designer of furniture and ornament from c.1760. Travelled to Italy, 1771; appointed architect to the Palace of Fontainebleau, 1772; worked in the service of the Landgrave Frederick II of Hesse, 1785; offered the presidency of the St. Petersburg Academy of Architecture, 1790. Also designed stage settings for Servandoni; exhibited designs for furniture at the Paris Salon from 1761. Member (first class), Académie Royale d'Architecture, 1767; member, Académie de Peintre et de Sculpture, 1771. Died in Paris, 2 November 1798.

Selected Works

Major drawings and designs for ornament and furniture by de Wailly are in the Musée du Louvre, the Musée des Arts Décoratifs, and the Musée Carnavalet, Paris. Additional drawings are in the Staatliche Kunsthbibliothek, Berlin; the Cooper-Hewitt Museum, New York; and the Hermitage, St. Petersburg. William Chambers's drawings of the Hôtel d'Argenson are in the Drawings Collection, Royal Institute of British Architects, London.

Interiors

- 1762–70 Hôtel d'Argenson, Paris (transformation of Germain Boffrand's interior): Marquis de Voyer
- 1764–69 Château de Montmusard, near Dijon (building and interiors): Marquis de la Marche
- 1767–82 Théâtre de l'Odéon, Paris (building and interiors with Marie-Joseph Peyre)
- 1769–78 Château des Ornes, Poitou (renovations and interiors)
- 1772–73 Palazzo Spinola, Genoa (redecoration of the Grand Salon): Marquis Cristoforo Spinola
- 1774–78 Hôtel de Voltaire, Paris (building and interiors): Voltaire

- 1776–78 Hôtel de Pajou, Paris (building and interiors): Augustin Pajou
 1776–78 Hôtel de Charles de Wailly, Paris (building and interiors): Charles de Wailly
 1778 Chapel of the Virgin, St. Sulpice, Paris (redcoration)
 1779–82 La Comédie Italienne, Paris (remodelling of interiors)

Publications

Première suite de Vases inventée et gravée par Dewailly, 1760

Wallhangings

The practice of using hangings, as opposed to painted or plaster decoration or panelling, to decorate walls is an ancient one that dates back to the 6th–8th millennia BC. Traditionally, such hangings were made of woven or embroidered textiles, although other materials such as embossed and gilded leather have also been used, and they were generally luxury items

often associated with the houses and palaces of the wealthy. Their function was predominantly decorative, allowing large expanses of wall to be covered with colorful designs, although in Northern climates they also served to cut down draughts of cold air. And it is equally obvious that wall-hangings were also an indication of the wealth of the owner, showing that after clothing, bedding and essential furnishings had been provided, there was still money available for fine fabrics that serve no other purpose than to hang on the wall. Early writers described the magnificent woven and embroidered hangings in the tents and palaces of the Babylonians and Assyrians. These were later copied and adopted throughout the Middle East and the Mediterranean countries. Their use was especially widespread during the medieval and Renaissance periods when their portability made them well-suited to the peripatetic lifestyles of European courts. Hangings sometimes became spoils of war, and were cut up and divided among the conquerors. Many secular hangings were moved to temples and churches, and church hangings were sometimes appropriated for private homes.

A wallhanging is a free-hanging piece of cloth, fastened to the wall by the upper edge or corners, or suspended from a rod or dowel. It can have a woven design, as in the case of tapestry, damask and brocade, or a surface decoration of embroidery, appliqué, quilting, paint or dye. Hangings can be designed as a piece, with borders and pattern to fit the space, or they can be a hemmed length of cloth cut from a larger piece. Many have fringes on the bottom. Carpets, rugs, and quilts are also sometimes hung on the wall.

An unusual form of wallhanging is the *tapa*, or bark cloth, of Polynesia. Polynesian *tapa*-making originated in Fiji and preceded the introduction of woven cloth into the islands. It spread to other parts of Polynesia and continues today. Bark cloth, although strictly speaking a form of felt similar to paper, is made from the bark of several members of the mulberry family (Moraceae). The bark is stripped from the tree, soaked, scraped, and beaten on wooden anvils with wooden mallets to form thin sheets. The sheets are painted or printed with hardwood dies or bamboo stamps. Large sheets were traditionally hung inside houses as partitions, protection against insects, and interior decoration.

Weaving of linen cloth for many purposes, including hangings, was established in Syria and Egypt by the 6th millennium BC. However silk from China became the fabric of choice for luxurious wall-hangings in the Middle East. Raw silk and finished pieces were brought overland on the Silk Road, a system of trading routes from central China through central Asia to the eastern shore of the Mediterranean. The Silk Road was well established by the 1st century BC. Raw silk was woven into cloth in Syria and traded with countries to the west.

Silk factories were established in Constantinople in the 4th century AD to cater to the Byzantine court and continued until the Ottoman conquest in 1453. Silk hangings dyed in many colors were used plain or decorated with animal and plant motifs, many of them based on designs from China. Cities in other parts of the Middle East established silk weaving centers that were described by Marco Polo in the 13th century. The Sasanians in Persia copied silk designs from India as well as China, and by the late 16th century under Shah Abbas I silk weaving had become the chief industry in Persia.

Byzantine and Islamic silks were traded extensively to Europe during the Middle Ages, and greatly influenced early Renaissance design. Silk weaving in Italy began when Roger II of Sicily brought weavers from Byzantium to Palermo in the 12th century. Lucca and Venice established silk factories, continuing the oriental floral designs. Genoa produced fine velvet for furnishings. Lyon and Tours were the centers of French silk manufacture, establishing fashions in design that were copied all over Europe by the mid-17th century. Oriental plant forms continued to predominate until the production of "bizarre" silks during 1700–30. These were patterns containing architectural motifs such as pavilions and archways along with plant forms in strange shapes and brilliant color combinations.

Direct trade by sea was developed by the Portuguese following the voyage of Vasco da Gama to India in 1498. Cotton was native to India, and Indian cotton manufacturers had devised methods of printing and painting with colorfast dyes. When the Portuguese arrived there was already a thriving trade in cotton goods among the South East Asians in exchange for spices, ivory, and other commodities. The royal courts of Thailand, Java, and other South East Asian countries had an established tradition of printed hangings in palaces and temples, and many of these cloths were produced in India in designs made specifically for individual markets in South East Asia. These bright, exotic fabrics called *pintados* by the Portuguese and chintz by the English were very popular in Europe by the early 17th century. Following the example of Asian traders, European traders took floral designs in European taste to the Indian manufacturers, who then reproduced them in Indian style for the European market. Large cloths, or palampores, usually featuring a tree design commonly called the "tree of life" were intended as bed coverings, but they were used as wallhangings also. The motifs were sometimes cut out and appliquéd to larger pieces, and the cloths were copied in embroidery as well. In the Scandinavian countries the oriental designs were incorporated into traditional embroidered hangings that were hung from walls and ceilings on holidays and other special occasions.

France and England passed laws prohibiting the import and production of the Indian style cloths in 1686, 1700, and 1720 in order to appease the silk and wool manufacturers who feared competition. However, infringement of the law was common, and printed cottons were produced in both countries. By the mid-18th century copperplate printing had been introduced, making possible monochrome prints with a series of repeats on lengths of fabric. Purple, red, sepia, and China blue were the most common colors. French *toiles de Jouy* are the best known of these. When rotary printing from engraved metal rollers was invented in 1783, mass production of printed cotton was begun, and the market for printed furnishing fabrics expanded to the middle and skilled working classes. Although used less frequently as hangings, such fabrics were sometimes stretched across battens that were then fixed to the wall, a practice that was also widespread with silks, cut-velvets and more expensive wallpapers.

The predominant style in Europe of the late 17th and 18th centuries, was Chinoiserie, a fantastic imaginary world of oriental motifs that was adopted by all of the applied arts. Some houses had entire "Chinese" rooms with all of the furni-

ture, hangings, and decorative objects done in a European version of oriental style. The rise in popularity of printed wallpaper during this period caused a diminished interest in fabric wallhangings, and hangings gave way to heavy curtains and draperies in the early 19th century.

From the late 1860s in England William Morris designed a number of woven and embroidered textiles in the neo-Gothic and Arts and Crafts style, and with the growth of interest in Art Needlework and exotic, oriental styles, embroidered hangings in particular enjoyed considerable popularity in several late 19th century Aesthetic homes. Strongly influenced by medieval and Renaissance precedents, Morris also revived the practice of using loosely gathered woven and printed fabrics as wall decoration. Photographs of his London home, Kelmscott House, show the drawing room hung with his woven textile *Bird*, and at Standen, Sussex, which Morris & Co. decorated in the 1890s for the solicitor James Beale, the dining room walls were hung with loosely gathered lengths of printed fabric *Daffodil*. Other Morris interiors of the 1870s and 1880s include walls decorated with silk stretched on battens in imitation of the practice that had been widespread in aristocratic houses during the 17th and 18th centuries.

Twentieth-century wall-hangings are the prerogative of the studio artist and the home needleworker. Artists working in textiles frequently execute commissioned hangings for public buildings and private homes in a variety of techniques including canvas embroidery, quilting, batik, hooked or knotted pile, and plain weaving. Bed quilts hung on the wall and smaller, pictorial wall quilts are very popular with needleworkers making home decorations. Batiks and hand-woven fabrics from many countries are often hung just as they are made, with no more than hemming on the top for a rod. Any decorative textile may now be hung on the wall to add color and interest to the room decor.

Wallpaper

The first reference to the use of wallpaper appears in the records of a payment made in 1481 for fifty lengths of painted paper that were hung in the Château of Plessis-les-Tours. The oldest example discovered *in situ* is generally thought to be the fragment removed from the ceiling beams of the Master's Lodge at Christ's College, Cambridge that dates from c.1509. Survivals of this kind are, not surprisingly, extremely rare, but there is sufficient evidence to suggest that small quantities of patterned paper were being used as decoration in most parts of Europe by the late 16th century. Initially, the attraction of these papers was their cheapness and novelty. The price of paper fell throughout this period and, as a result, it was increasingly viewed as an attractive alternative to other forms of decoration in use at the time. Tapestries, textiles and embossed leathers continued to dominate the market for luxury hangings, but patterned paper represented an admirable substitute for less costly wall-treatments such as painted and stencilled plaster-work. Wallpaper did not entirely replace this style of work, but the early examples were clearly intended for modest houses or lesser rooms where, previously, painted patterns might have been employed.

During the 16th and 17th centuries wallpaper was printed from wood blocks on small, rectangular sheets that rarely measured more than 16 or 20 inches in length. The patterns appeared in monochrome; colour was not introduced until the late 17th century when it was applied through the medium of crudely-cut stencils. For much of this period too, patterned papers were used as lining-papers and on furniture as well as on ceilings and walls. A variety of pictorial and ornamental motifs were employed, but the majority of patterns followed fashions in contemporary wood and textile design. Discoveries made in Holland, Switzerland, and Poland suggest that imitation wood-grain and intarsia effects were favoured for ceilings, while in England many of the papers used on walls featured stylized floral and foliage motifs derived from contemporary embroidery and needlework. Renaissance ornament and armorial devices also proved quite popular, and a sample removed from Besford Court (1575) includes the arms of Elizabeth I and the Order of the Garter as well as grotesque masks and fruit-filled urns. French wallpapers, produced by *dominotiers* or image-sellers, were much simpler in style and had small geometric patterns featuring circles, lozenges, and cubes. These papers were used mainly by shopkeepers and artisans.

By the end of the 17th century the market for wallpaper was expanding. From the 1680s the French *dominotier* Jean Papillon began introducing larger, more colourful designs that were printed over several sheets of paper and that formed a consecutive pattern when pasted on the wall. These papers, known as *papiers de tapisserie*, were apparently quite fashionable and, by 1700, there was reputedly "not a house in Paris, however grand, that does not contain some example of this charming decoration, even if only in a wardrobe or other private room". Nevertheless, it was some years before wallpaper was regarded as an acceptable alternative for more luxurious hangings in "parade" or formal rooms.

An important development occurred in the late 17th century when English paper-stainers began joining the small sheets together to form long 12-yard rolls. This freed the design from

Wallpaper: Flock paper and border at Clandon Park, Surrey; British c.1735

the confines of the sheet size and allowed for larger, more imposing patterns that approximated more closely to the appearance of costly textiles. An even more significant innovation was the introduction of flocking techniques. Flocked hangings, where finely sieved wool shearings were shaken over a ground prepared with a design printed in varnish or size, had first appeared in Holland in the late 16th century. Originally the flock was applied to canvas or linen supports, but, by the 1620s, English firms had patented a technique whereby the flock adhered to painted paper grounds. Subsequently flocking became an art in which English paper-stainers excelled.

The appeal of flock papers lay in their resemblance to expensive cut velvets and silk damasks, and the most ambitious examples had large Baroque designs with vertical turn-over repeats of up to six feet long. Such papers were intended for the most formal of interiors, and in 1720 William Kent replaced the textile hangings in the drawing-room at Kensington Palace with a set of sumptuous damask designs. An equally impressive brocade pattern was hung in the Offices of the Privy Council at Whitehall in 1734 and many fine examples survive today in the state apartments of great houses such as Temple Newsam (Leeds), Christchurch Mansion (Ipswich) and Clandon Park (Surrey). For much of the 18th century it was customary to hang flocks and other expensive wallpapers

Wallpaper: pillar and arch pattern; British, 1760s

on a canvas backing that was attached to battens nailed to the wall. This was done primarily to protect the paper from damp but it also meant that the papers could be taken down for cleaning or re-hanging if required, and it provides a good indication of the degree to which such goods were prized. The flock paper in the Royal Bedroom at Clandon is still hung in this way and has matching borders at the top and bottom of the wall that conceal the nails.

From the 1750s the fashion for English flocks spread to France. Large numbers of *papiers d'Angleterre* were imported to decorate the houses of the nobility and in 1754 Mme. de Pompadour ordered a set of English papers for the dressing-room and corridor of her apartments at Versailles. Chinese wallpapers were also much in demand as a luxury decoration at this time. Hand-painted in tempera or gouache on long

panels, these papers had large non-repeating designs that depicted scenes of Chinese life or an assortment of exotic plants and birds. They first appeared in Europe in the 1650s and reached the height of their popularity in the middle decades of the 18th century when the taste for Chinese lacquered furniture and porcelain was also at its height. The main centres of supply were London and Paris, but examples were sold all over Europe and in North America. Their bright colours and the delicate treatment of their designs made them particularly appropriate for Rococo-style rooms; they were most often hung in intimate settings such as bedrooms, closets, and dressing-rooms.

Ironically, the Chinese themselves did not use wallpaper: the examples sold in Europe were produced exclusively for export. However, such was the appeal of their designs that European manufacturers soon began producing printed and painted imitations. Even more significantly, the naturalism and detail of Chinese papers suggested new standards of excellence to which wallpaper might aspire, and improvements in the block-cutting and printing processes meant that by the 1760s perfectly registered, polychrome patterns, block-printed in distemper pigments, were no longer the exception to the rule.

By the third quarter of the 18th century wallpaper was firmly established as one of the more fashionable decorations available for the upper-middle-class and aristocratic home. Important centres of manufacture were beginning to emerge in many parts of Europe and North America and the names of firms, such as J.C. Arnold of Kassel, the Reimondini family of Milan, and J.F. Bumstead of Boston, might be cited as evidence for the vitality of the industry at this time. The wallpaper industry in England was a particularly thriving concern. More than 70 paper-stainers were active in London in the 1780s and the most prominent firms, like Sherringham's of Marlborough Street, the Eckhardt Brothers of Chelsea, and Thomas Bromwich of Ludgate Hill, opened large showrooms in the centre of the city where they served a wealthy clientele. Thomas Bromwich worked on a number of important commissions, including Cobham Hall, Kent and Fawley Court, Buckinghamshire, and in 1754 he supplied Horace Walpole with a set of Gothic patterns for his villa at Strawberry Hill. The work of the Eckhardt Brothers and Sherringham was no less in demand. Both firms enjoyed royal patronage and the Eckhardts damask flocks, and Sherringham's lace and silk designs were widely admired. Further down the social scale there was a healthy trade in finely-coloured Rococo floral patterns and small sprigged and diaper designs. Landscape papers, incorporating views of picturesque ruins, and stucco patterns featuring architectural niches and façades were also popular; the latter was a special favourite for stairways and halls.

Many of these English papers sold well abroad, but from the 1770s French manufacturers usurped their English counterparts as the recognised leaders in wallpaper design. The work of Jean-Baptiste Réveillon was particularly outstanding and exemplified the high position to which wallpaper had risen by this time. Réveillon began his career as an importer and retailer of English goods but by 1767 he was manufacturing his own papers at a large, modern factory in the Faubourg St. Antoine. In 1780 he acquired a paper factory at Courtelans-en-Brie and ten years later he was employing upwards of 300

men. In addition to its size, Réveillon's firm was notable for the quality and artistry of the wallpapers it produced. The company employed several prominent designers, including Charles Huet and J.B. Fay, and specialized in highly-coloured Chinoiserie and Neo-Classical designs. In the late 1780s it also issued some striking imitations of Roman wall paintings that incorporated roundels, plaques and architectural motifs inspired by the recent discoveries at Herculaneum and Pompeii. These papers were usually hung in long vertical panels and were enclosed by co-ordinating borders.

The next generation of French wallpaper designers favoured more illusionistic styles, and the early work of the Parisian manufacturer Dufour et Cie., and Zuber et Cie. of Rixheim, encompassed the Directoire fashion for *trompe-l'oeil* imitations of gathered muslins and pleated or scalloped silks. These firms also specialized in the panoramic and scenic decorations that enjoyed considerable popularity in the first quarter of the 19th century. Hand-printed in colour or grisaille, these decorations appeared more like murals than wallpapers, and had complex, non-repeating, pictorial designs representing exotic landscapes, historical subjects and mythological themes. The technical skill involved in producing such work was staggering. Dufour's *Cupid & Psyche* series (1816), for instance, required approximately 1,500 blocks to print. These scenic decorations did much to enhance the reputation of French wallpapers at home and abroad. Many examples were exported to America, and during the 1960s a version of Zuber's *Vues de l'Amerique du Nord* (1834) that had originally hung in the Stoner House, Maryland, was re-used in the White House. Yet, compared with the vast numbers of ordinary repeating patterns produced by French firms, the influence of scenic wallpaper was small and it was only the wealthiest sections of society, whose houses had large rooms, who could afford to purchase or accommodate these designs.

With the advent of machine-printing in the 1840s wallpaper became available to a far wider range of homes. Hand-printing did not disappear – indeed, it was always preferred for more expensive work – but the second half of the 19th century witnessed a veritable explosion of cheap, mass-produced designs. Many of these, on both sides of the Atlantic, adopted historical styles, the most popular being Gothic Revival and Rococo Revival patterns. Rococo patterns, in particular, satisfied a passion for richly elaborated ornament that was evident in almost every area of mid-century design. They contained naturalistic floral sprays set within a framework of bulbous foliage scrollwork and their strong colours and dense patterning harmonized well with the other furnishings and ornaments in the middle-class Victorian home.

By the 1860s English critics had begun to object strongly to the realism of these designs and called for two-dimensional patterns that would enhance, not contradict, the flat surface of the wall. By this time too, wallpaper had assumed far greater importance in the decoration of the home. It was used everywhere, even in kitchens and bathrooms, and on ceilings – there was no such thing as a plain wall. It was also no longer regarded simply as a finish, or as a substitute for more expensive wallcoverings, but was seen as an essential part of a room's overall design. As a result, many well-known architects and artists became involved in wallpaper design. During the last quarter of the century, fashionable interiors might be deco-

Wallpaper: detail of machine print by John Woollams & Co., as featured in the *Journal of Design*, 1850

rated in a variety of artistic styles that ranged from the Japanese-influenced designs produced by Christopher Dresser, E.W. Godwin and Bruce Talbert to the conventionalized floral patterns popularized by Art and Crafts designers such as William Morris, Walter Crane, and L.F. Day. In many of these rooms, the wall was divided into three horizontal sections – frieze, fill, and dado – and manufacturers produced co-ordinating patterns that were designed to suit the respective areas of the wall.

The last quarter of the 19th century also saw the introduction of many new materials and printing techniques. "Sanitary" papers, which purported to be completely washable, appeared from 1871. Printed in oil based colours from engraved copper rollers, these papers were especially suitable for kitchens, bathrooms, and halls, and, at a time when concern about hygiene reached the level of an obsession, the name alone was enough to guarantee their appeal. Relief decorations, such as Lincrusta Walton (1877) and Anaglypta (1887) emerged soon afterwards. These papers had raised patterns and were painted to resemble embossed leathers and panelling. Like Sanitaries they were washable. They were also extremely durable and, as a result, they were often used as

Wallpaper: *Fruit or Pomegranate*, designed by William Morris, c.1865 (detail)

dado papers on stairways or wherever the wall was subject to excessive wear and tear.

Art Nouveau patterns produced at the end of the 19th century were frequently strongly coloured and exceptionally bold, but by the first decade of the 20th century more progressive architects and designers were beginning to favour a return to simpler, more restrained styles of interior design. Friezes remained popular but they were usually combined with plain walls. There was also a revival of interest in Regency and early Victorian chintz designs. By the second quarter of the century the appeal of densely patterned interiors had definitely begun to pall and the pioneers of functionalism rejected wallpaper as too decorative, viewing it as superfluous to the requirements of the modern room. Nevertheless wallpaper remained the standard form of decoration for the majority of homes and during the 1920s and 1930s the more fashion-conscious consumer could choose from a range of exciting Jazz-Age and Cubist-style designs.

The 1950s and 1960s were also invigorating years when developments in modern art inspired the use of large geometric and abstract motifs. Once again, architects and painters were often involved: the launch of the *Palladio* range (1956) in England and Schumacher's Frank Lloyd Wright designs (1956)

in the United States represented an attempt on the part of the industry to re-establish the reputation of wallpaper within the avant-garde. Most manufacturers, however, veered towards more conservative styles of design and concentrated instead upon technical developments, such as the introduction of pre-trimmed and ready-pasted papers and washable, vinyl surfaces as a means of promoting sales. A notable exception to this rule was the launch of the first co-ordinated range of fabrics and wallpapers by the London-based company Arthur Sanderson & Sons in 1962. Similar ranges were soon introduced by other companies and matching textiles and wallpapers are now an integral part of many middle-class homes.

Since the 1970s decorative paint finishes have become increasingly popular and wallpapers imitating stippled and marbled effects have been produced by many firms. In recent years there has also been a growing interest in historical styles of design. This trend began in the 1960s when firms such as Laura Ashley began to revive a number of early 19th century sprig and floral patterns. Since then it has been greatly encouraged by the fashion for authentic decor which has also done much to promote the use of wallpaper generally in wealthier homes. Many companies like Brunschwig & Fils in America and Mauny's in France now specialize in reproduction designs,

Wallpaper: *Design 706* by Frank Lloyd Wright, 1960

and versions of period styles appear in most contemporary ranges.

JOANNA BANHAM

Selected Collections

Large collections of historic wallpapers are held by the following institutions: in Australia by the Resource Centre for Historic Houses Trust, Sydney; in Britain by English Heritage, the Silver Studio, and the Victoria and Albert Museum, London, Temple Newsam House, Leeds, and the Whitworth Art Gallery, Manchester; in France by the Bibliothèque Forney, and the Musée des Arts Décoratifs, Paris, and the Musée du Papier Peint, Rixheim; in Germany by the Deutsches Tapetenmuseum, Kassel; in Sweden by the Nordiska Museet, Stockholm; and in the United States by the Cooper-Hewitt Museum, New York, and the Society for the Preservation of New England Antiquities, Boston.

Walton, George 1867–1933

Scottish architect and designer

George Henry Walton was one of the most versatile designers of his day, but his reputation has too often been eclipsed by his more celebrated Glasgow contemporary, Charles Rennie Mackintosh. Largely untrained, Walton drew inspiration from a range of sources. Heavily influenced by J.M. Whistler's experiments as an interior designer, he demonstrated an equal enthusiasm for the Arts and Crafts, aligning himself to the movement at an early stage in his career. These influences came together in the potent creative atmosphere of Glasgow in the 1890s where an atmosphere of intense experimentation and innovation was to result in a recognisable Glasgow Style. For Walton the result was a body of work that could be eclectic and varied but at its best included some of the most elegant, sophisticated and beautiful interiors produced at the turn of the century.

Walton was from a particularly gifted artistic family, and was the youngest of eleven children. His brother, the painter E.A. Walton, was a leading member of the Glasgow school of painters and a devotee of Whistler. In his youth, George was surrounded by painters and the process of painting. These earliest influences were to have a lasting effect on his work. They explain his enthusiasm for contributing murals (of varying quality) to his own interior schemes, but at a deeper level they also suggest why the painterly concerns of colour, surface and pattern were paramount in much of his work. His approach was that of an artist working on a three-dimensional canvas, drawing in the elements of the interior to a single decorative effect.

After initially working as a bank clerk, Walton established his firm of Ecclesiastical and House Decorators in 1888. Initially confined to painting and paperhanging, the firm rapidly expanded to include furniture and stained glass design taking on more substantial commissions through the decade. It was a period of experimentation, and it is not until towards the end of the 1890s that a sense of coherence began to emerge in Walton's designs. Two commissions for the tea room proprietor, Kate Cranston, at Buchanan Street and Argyle Street, resulted in Walton's most harmonious interiors up to that date.

Before work at Argyle Street had been completed, Walton had left Glasgow for London. The following year, after the success of a further tea room commission at Scarborough, the firm opened a shop in York and completed a major interior refurbishment at Elm Bank, a private house in the city. The drawing room demonstrated Walton's increasing interest in 18th-century furniture design. The colour scheme was a subtle mix of purples and greens with a woven silk and linen textile lining the walls.

Although no office was established in London and the firm's workshops remained in Glasgow, London now became the focus of its activities. Through his Glasgow friend, the photographer James Craig Annan, Walton had come into contact with George Davison, a leading amateur photographer in London and shortly to become an assistant manager with the Eastman Photographic Materials Co. (later Kodak Ltd.). Davison was to become the dominant client of the second half of Walton's career both on a professional and private basis. The design and

Walton: dining room, The Leys, Elstree, 1901

decoration of the Eastman Amateur Photographic Exhibition at the New Gallery, Regent Street in 1897 was followed by a series of lavish new showrooms for Kodak in prime commercial sites in the capital. Between 1898 and 1901 showrooms were opened on Regent Street, The Strand, Oxford Street and Brompton Road. Designed entirely by Walton, they combined increasingly sophisticated furniture with highly decorative stained glass and metalwork. A distinctive palette that included staining the frontage of The Strand showrooms a deep purple further helped to draw attention to the façades and their interiors. The showrooms succeeded in achieving a domestic sophistication while presenting a definitely modern identity for the new company. Further premises were opened in Glasgow, Dublin and on the Continent in Brussels, Vienna, Milan and Moscow.

Walton's growing reputation as "Decorator-in-chief to photographers" was consolidated by his first architectural commission: a private house, The Leys at Elstree, for the photographer and photographic paper manufacturer J.B.B. Wellington. The Leys was externally plain and symmetrical, but the interior was dominated by a triple-height hallway that doubled as a billiard room. The decoration of The Leys marked a transition from the heavily stencilled appearance of Walton's earlier work to a sparer decoration using tinted glazes and more restrained decoration.

The first years of the new century saw the completion of some superb domestic interiors including Alma House, Cheltenham (c.1904) and The Philippines, Brasted, Kent (c.1905). These showed little trace of any Glasgow eccentricity and replaced an Arts and Crafts homeliness with an assured elegance that placed Walton at the forefront of contemporary interior design.

By 1905, Davison was already an important private client. His early investments in the fledgling Kodak company had provided rich rewards, and in 1908 he commissioned two houses from Walton, the White House at Shiplake in Oxfordshire and Wern Fawr at Harlech in North Wales. The former, designed for summer, was light, all open and bright. Inside the walls were left roughly plastered and unstencilled, contrasting with the highly finished ebonised furniture, designed by Walton in his most Aesthetic manner. Wern Fawr could not have been more different. Built from local granite, it was a substantial house entirely designed, furnished and decorated by Walton with little expense spared. Again, Walton's treatment of the interiors was spare and minimal, setting the furniture against tinted plaster walls. Wern Fawr was further extended in 1911 with the addition of a 300-seat concert hall panelled in Italian walnut; it contained an imposing organ behind Walton's whimsically designed and immaculately carved screen.

The exuberance of these extraordinary commissions contrasts markedly with what was to follow. On the completion of the concert hall, Walton found it increasingly difficult to find work in London. In 1916 he joined the Central Control Board (Liquor Traffic). The C.C.B. was charged with resolving the problems of increasing drunkenness in the public houses around munitions bases. Walton was commissioned to design comfortable but modest interiors that would contrast with the "spit and sawdust" image of the conventional drinking houses and encourage more moderate consumption. The success of Walton's schemes was expressed by his friend and colleague C.F.A. Voysey who thought Walton had made "many public houses into public places". Other than small architectural commissions from old friends and clients, including a memorial chapel to George Davison, much of Walton's last years were spent designing textiles. He died in 1933 aged 66.

Biography

George Henry Walton. Born in Glasgow, 3 June 1867, elder brother was the painter, Edward Walton; sisters were the designers Helen and Hannah Walton. Worked as a bank clerk; studied art at evening classes, Glasgow School of Art. Married 1) Kate Gall, 1891 (died 1916); 2) Dorothy (Daphne) Anne Jeram 1916: 1 son. Left banking and established George Walton & Co., Ecclesiastical and House Decorators, Glasgow, 1888; moved to London but retained Glasgow company, 1897; opened branch in York, 1898; resigned 1903 and practised independently as an architect and designer; architect and designer for the Central Control Board (Liquor Traffic), 1916–21. Designed furniture, textiles, wallpapers, table glass and stained glass for various firms including Liberty and Alexander Morton & Co. Exhibited periodically at the Arts and Crafts Exhibition Society from 1890 and at the Arts and Crafts Exhibition, Budapest, 1902. Member, Art-Workers' Guild. Moved to Hythe, Kent, 1930. Died in Hythe, 10 December 1933.

Selected Works

The two main archives of Walton's work are the vast collection of documents, sketchbooks, photographs and objects, known as the George Walton Archive, in the National Archive of Art and Design, Victoria and Albert Museum, and the collection of photographs and architectural drawings in the Drawings Collection and Library of the Royal Institute of British Architects. Documents relating to Walton's Glasgow company are held in the Scottish Record Office, Edinburgh; material relating to Walton's work in exhibition and showroom design are in the Archives of Kodak Ltd., National Museum of Photography, Bradford. Examples of Walton's furniture, textiles and table glass are in the Victoria and Albert Museum, London.

Interiors

- 1896–97 Tea Rooms, 114 Argyle Street, Glasgow (decorations; & 1899 furniture by C.R. Mackintosh): Kate Cranston
- 1896–97 Tea Rooms, 91–93 Buchanan Street, Glasgow (furnishings; decoration by C.R. Mackintosh): Kate Cranston
- 1898 Elm Bank, York (decorations, fittings and furnishings): Sidney Leatham
- 1898 Kodak Head Office, 41–43 Clerkenwell Rd., London (decorations and furnishings including the boardroom and showrooms): Eastman Photographic Materials, later Kodak Ltd.
- 1898–1902 Kodak Showrooms, London, Glasgow, Brussels, Dublin, Milan, Vienna, Moscow (façades, decorations and furnishings): Kodak Ltd.

- 1901 The Leys, Elstree, Hertfordshire (building and interiors including furnishings): J.B.B. Wellington
- 1901 44 Holland Street, London (decorations and furnishings): George Walton
- 1908–10 Plas Wern Fawr, Harlech, Wales (building and interiors): George Davison
- 1908 White House, Shiplake, Oxfordshire (building and interiors including furnishings): George Davison
- 1914 32 Holland Park, London (remodelling, interiors and furnishings): George Davison
- 1916–21 Refurbishment of public houses (decorations and furnishings): Central Control Board (Liquor Traffic)

Designed furniture and fittings, decorations, textiles, stained glass for George Walton & Co., 1888–1903; wallpapers for Jeffrey & Co., London; table glass for Clutha; stained glass for James Powell & Sons; furniture for J.S. Henry and Liberty; textiles and carpets for Alexander Morton & Co.

Warner & Sons Ltd.

British textiles manufacturer; established 1870

Founded as a wholesale and manufacturing firm in 1870, Warner & Sons' significance derives both from its own history of production and the collection it amassed through the acquisition of a number of other firms. The firm's founder, Benjamin Warner (1828–1908), was the son of a Spitalfields' Jacquard harness builder (also Benjamin) who died in 1839, leaving his

business to his widow Anne. Having trained at the Spitalfields School of Design (founded 1842), the younger Benjamin extended his father's trade to include designing, and in 1857 acquired the designs, equipment and Spitalfields premises of a French designer, Alphonse Brunier. Warner was in partnership with the designer William Folliott (1836–1926) for two years prior to the creation of the wholesale firm.

Warner's knowledge of the Jacquard mechanism and of design allowed the firm to specialise in the highest quality figured silks. Although it occasionally wove fabrics for ceremonial robes and dresses, its reputation rested on silk furnishing fabrics, which for one hundred years were woven to order. Many were in traditional style, but between 1870 and 1900 the firm also purchased designs from Owen Jones, E.W. Godwin, G.C. Haité, Bruce Talbert, Lindsay Butterfield, A.H. Mackmurdo, W. Scott Morton, Sidney Mawson and Arthur Silver. Few records of customers survive, but it is known that in the 1870s several Jones designs were woven for Jackson & Graham and a design by Talbert was supplied to Gillows for Mandeville Hall (Toorak, Victoria).

Other customers included Waring & Sons, Collinson & Lock, Lengyon & Morant, T.W. Cutler, Williamson & Sons, Liberty & Co., Reville and Rossiter and Debenham & Freebody, the latter three mainly with dress silks. From 1874 the firm supplied printed fabrics, produced by outside printers and often from exclusive design, including some by Jones and C.F.A. Voysey. They also wove with wool, and in 1878 they began weaving figured velvets, making technical improvements which culminated in 1914 with a patent for velvet with three heights of pile, a method developed by Frank Warner (1862–1930).

By 1900 Warner & Sons were the foremost furnishing silk weavers in Britain, having acquired their two major rivals. The first, in 1885, was Charles Norris & Co. silk and silk / wool furnishing fabric manufacturers and wholesalers in Wood Street and Victoria Park, East London. In the early 19th century Norris had taken over William Lynes with their patterns dating back to 1760 (now in the Victoria and Albert Museum) and in 1868 had acquired Daniel Keith & Co., itself evolved from Stephen Wilson & Sons, the proprietor of which had introduced Jacquard weaving into Britain in 1820. Keith's customers included Hindley & Son, and both Norris and Keith produced a number of designs in Gothic Revival style for Crace & Son, including at least one by A.W.N. Pugin. Norris's position as a supplier of traditional silks and velvets for royal households appears to have transferred to Warner & Sons with their purchase. Daniel Walters & Sons, founded out of a brief partnership established with his brother Stephen in Braintree in 1822, also supplied royal households, as well as producing designs by Owen Jones, Bruce Talbert and William Folliott and supplying printed chintzes and cretonnes. Their factory, New Mills, was one of the first and largest furnishing silk weaving complexes in the country, and many of their Jacquard looms ran by steam from 1870 until their closure in 1893. Warner & Sons acquired Walters's patterns and premises in 1894 and by 1910 had closed their Bethnal Green factory and transferred all but a handful of cottage weavers to New Mills. No written records of Keith, Norris or Walters survive, but many samples are retained in the Warner Archive.

From 1907 to 1930 developments were guided by Frank

Warner (sole partner from 1915). He actively promoted better design education, the silk industry, and the Design & Industries Association, of which he was a founder member. He co-authored the report on the 1925 International Exhibition and *The Silk Industry* (1921) remains a standard work. During his years as director powerweaving was introduced (1919), a Paris office was opened (1922–26) and a block-printworks in Dartford purchased (1926). Modern designs were produced, including a tapestry by Walter Crane, but the more typical orders in this period were traditional patterns for government offices, Windsor Castle, Buckingham Palace, Cowtan & Sons and Morris & Co. Their reputation for accurate historical reproductions was solidified in this period. As the decorating profession expanded, the provision of traditional chintzes also became increasingly important, a factor which underpinned the expansion of trade in America, where customers in the inter-war period included Elsie de Wolfe.

In 1928 the new limited company's board included Frank's son-in-law, Sir Ernest Goodale, who was managing director from 1930 to 1962 and also active outside the firm, including serving on the Board of Trade and other government committees, 1934–60 and on the Council of Industrial Design, 1944–48. He supplemented the existing design studio with the appointment of Alec Hunter (1899–1958) as a designer in 1932 (director from 1943); in the same year hand screen-printing was introduced at Dartford. Hunter extended the purchasing of freelance designs, particularly for printed textiles, whether modern designs from, for example, Louis Aldred, Jacqueline Groag and Edward Bawden, or traditional styles from British and Continental design studios. From the late 1920s the firm's production is extremely well-documented, and included, in the 1930s, the production of modern woven and printed fabrics for RMS *Queen Mary*, *Orion* and *Orcades*, and for Gordon Russell Ltd., Marion Dorn Ltd., Fortnum & Mason and Dunn's of Bromley, the latter selling fabrics and cushions by Theo Moorman (1907–90), who was employed at New Mills from 1935 to 1939. Hunter developed modern weaves in a wide range of fibres, often using traditional hand techniques including brocading, and among his major projects were fabrics for the British Broadcasting Corporation (1931, while at Edinburgh Weavers), and the Royal Institute of British Architects' (1934) headquarters, and the University of London's Senate House (Charles Holden, 1938), all in London. In 1936 they had over 15,000 furnishing fabrics in their range. During World War II this was reduced to Utility fabrics, using the supplied Enid Marx designs as well as those by their own staff designers; the printworks was closed.

In 1950 Warner & Sons acquired the designs and some looms from Helios (a subsidiary of Barlow & Jones) and, with these, the designer Marianne Straub, whose designs of the 1950s and 1960s were widely used, for example by the Ministry of Works, Heal Fabrics Ltd., Ercol Furniture, the Design Research Unit and Tamesa Fabrics, which sold only her weaves from 1965 to c.1970. Straub concentrated on dobby weaves, while the majority of Jacquard designs after 1958 were created by Frank Davies (1925–90), who joined the firm in 1951 and together with Straub provided modern designs for many schools, polytechnics, theatres, embassies and ships, including the liner *QEII* (all details survive in the Warner Archive). After the war the firm returned to their use of outside

printers and handled the range of Greeff Fabrics Inc., New York, from 1955. Their production of prints for their own wholesale range expanded rapidly, with the Ministry of Works placing massive orders for a handful of modern designs; traditional chintzes were also produced exclusively for London decorators such as Colefax & Fowler, Jean Munro and George Spencer, and for many of the leading American wholesale fabric houses. Increasingly using outside weavers to supply their own range, weaving to commission ceased at New Mills in 1971.

The firm was sold in 1978 to Gulf & Western Industries Inc., and in 1985 to Wickes Companies Inc.. It became Warner Fabrics plc in 1987 and aside from its standard wholesale range, still supplies commissioned prints and hand and power weaves to decorators, wholesale firms, historic houses and Royal residences, and actively exhibits from their Archive. The company acquired Harris Fabrics in 1989 and in 1994 were sold to Walter Greendale plc.

MARY SCHOESER

Selected Collections

A vast collection, containing a near-complete range of Warner's textiles and numerous examples of textiles produced by the companies that it has acquired, art-work and company records, is in the Warner Archive, Braintree, Essex.

Webb, John 1611–1672

English architect

The work of the English architect John Webb has long been associated with that of Inigo Jones whose style of architecture and design he developed and continued after Jones's death and into the Restoration. But although he was strongly influenced by Jones, Webb succeeded in evolving a personal manner that bridged the gap between Jones's academic Palladianism and early English Baroque. He favoured grand, impressive spaces, particularly the antique sequence of columned halls and cube rooms, and his drawings, several hundred of which survive, show him to have been closely concerned with the design of interior fittings such as chimneypieces and detailed carvings.

Webb was born in London and became a pupil of Jones in

1628; a little later he married Anne, Jones's niece or illegitimate daughter. And from the 1630s on, he was Jones's personal assistant, in charge of two of his most important works, the restoration of old St. Paul's Cathedral and the building of the Barber-Surgeon's Theatre. In 1638 he produced an independent design for a lodge or villa for John Penruddock at Hale Park, Hampshire and a stable for a Mr. Fetherstone at Hassenbrook, Essex. It was perhaps also at this time that he made the first of many drawings for a new Whitehall Palace, designed in the Palladian manner Jones had used at the Banqueting House. Also in 1638 he made for the queen a design in this same style of an elevation for a proposed extension at Somerset House, London. The coming of the Civil War in 1642 ended these projects, though Webb seems to have acted as agent for the king and continued to work on projects for the palace at Whitehall. It was about this time that he did some work at Wilton House in Wiltshire after the fire of 1647, especially on the great Double and Single Cube Rooms, finished by 1650.

Jones died in 1652 and for the next few years, with no serious professional competition in England, Webb was very busy, working for the Earl of Rutland at Belvoir, for the Earl of Peterborough at Drayton, and for Sir Justinian Isham at Lamport. In 1655, perhaps from a softening of his political sympathies, Webb worked for a Parliamentarian, Colonel Edmund Ludlow, for whom he produced a design for a house at Maiden Bradley. It was also at this time that he began work for Sir John Maynard at Gunnersbury House, Middlesex. When Charles II was restored as monarch in 1660, Webb was passed over – perhaps for political reasons – for the position of Surveyor of His Majesty's Works in favour of John Denham. But he was a deeply experienced architect and designer, and by 1663 he was recalled to design the King Charles II Block at Greenwich, to work at Woolwich Dockyard and, like Jones before him, to help in the design of the masques produced at the court, most notably *The Tragedy of Mustapha* performed at Whitehall in 1666. In 1669 Denham died, but once again Webb was passed over as Surveyor in favor of Christopher Wren, the rising star; he died three years later.

Webb's career was not a complete success, perhaps because of the troubled times. But he was recognised always as the true heir to Inigo Jones and from his activities and general interests he did much to confirm the new social and intellectual position for the architect that Jones had laid claim to. He was a scholar of architectural history, in particular studying the writings of Palladio and Scamozzi. He was also a writer of some note; in 1655 he published Jones's account of Stonehenge; in 1669 he put out a curious essay on the antiquity of the Chinese language; and he also planned a treatise on architecture, never completed, for which drawings are preserved at Worcester College, Oxford.

It was perhaps in his interiors that Webb exercised most influence, especially in the rooms designed for Wilton House (1648–51), and Amesbury House, Wiltshire (1659–64). Wilton House later became closely identified with the development of English Palladianism and Webb was involved in both major stages of its construction. During the 1630s he assisted Jones (who rebuilt the garden front in an Italianate manner) in making designs for ceilings and doors, and after a fire of 1647 he was in sole charge of refitting the south-side State Rooms.

John Webb: Double Cube room, Wilton House, Wiltshire, late 1640s

This work included the design and decoration of the celebrated Double Cube Room, a space that measured 60 feet long by 30 feet wide and 30 feet high, and that exemplified Webb's liking for grand impressive spaces. He replaced the original flat ceiling with deep painted coves decorated by Edward Pierce, and provided wall paneling embellished with richly carved swags of fruit, garlands of flowers and foliage suspended from cartouches. The chimneypiece and magnificent vast double doors on the east side of the room were designed by Webb after the engravings of Jean Barbet. Additional chimneypieces in the King's Bedchamber (remodeled c.1735 to form the Colonnade Room) and adjoining closet were also inspired by Barbet's designs. Similarly Francophile features appear in Webb's drawings for the King Charles Block at Greenwich which include friezes and ornament derived from Barbet and Jean Cotellet as well as a bed alcove reminiscent of Jean Le Pautre, and coved ceilings with inset rectangular panels surrounded by foliage and figures that are comparable to his designs for Wilton.

The question of Webb's style, however, is not altogether straightforward. Although, like Jones, he relied heavily on French sources that represented a restrained form of classicism, he was also open to other possibilities. This can be seen in the great portico that he added at The Vyne, Hampshire (1654–57), and at Gunnersbury, Middlesex (1660–64), which also included a fine set of state rooms including another coved, double-cube saloon, and a grand Imperial staircase of the kind first used by Philip II in the Escorial. And at Greenwich, Webb's work included the first correct use of the giant order, a feature that inspired the Baroque architects Hawksmoor and Vanbrugh, who later added to this building. Perhaps Webb's greatest influence was felt some fifty years after his death when Colen Campbell and Lord Burlington revived Jones's Palladian style and in so doing regenerated interest in Webb's work. But although Webb carried on Jones's tradition of Italian and French influences, his work was somewhat heavier and more muted than that of the older architect, and he may be best understood as standing, both chronologically and stylistically, between Jones and the new grander classicism of Sir Christopher Wren.

DAVID CAST

See also Inigo Jones

Biography

Born in Smithfield, London in 1611. Educated at the Merchant Taylors' School, London, 1625–28. Pupil and then assistant to Inigo Jones (1573–1652), 1628–43; assisted Jones on his most important architectural projects, including Somerset House, and with his designs for masques; acted as Jones's executor. Married Anne, the niece of Inigo Jones: 8 children. First independent architectural designs from 1638. Following the outbreak of Civil War, attended Charles I at Beverley, 1642–43, and at Carisbrooke Castle, 1647–48. Petitioned unsuccessfully for the post of Surveyor-General after the restoration of the monarchy, 1660. Worked on the King Charles II block at Greenwich, 1663–66. Designed stage sets for court masques including Davenant's *Tragedy of Mustapha* (1666) from 1663. Worked on a long theoretical architectural treatise, c.1635–50 and published works on Stonehenge and the Chinese language. Retired to Butleigh Court, Somerset, 1669. Died in Somerset, 30 October 1672.

Selected Works

Several hundred of Webb's drawings and designs are in the Drawings Collection of the Royal Institute of British Architects, London; additional designs are in Worcester College, Oxford.

Interiors

- 1638–39 Wilton House, Wiltshire (interior fittings; restoration & 1648–51 and rebuilding of the south range including the refitting of the State rooms)
- 1653 Drayton House, Northamptonshire (chimneypieces and overmantels for the bedchamber and withdrawing room): Earl of Peterborough
- 1654–57 The Vyne, Hampshire (alterations, great portico and chimneypieces): Chaloner Chute
- 1654–57 Lamport Hall, Northamptonshire (new wing, alterations and interiors): Sir Justinian Isham
- 1655 Chevening Hall, Kent (additions and interior fittings)
- c.1655–60 Northumberland House, London (additions and interiors including chimneypieces and overmantels for the State rooms)
- 1658–63 Gunnersbury House, Middlesex (building and interiors): Sir John Maynard
- 1659–64 Amesbury House, Wiltshire (building and interiors): Marquess of Hertford
- 1663–66 Greenwich Palace, Greenwich (King Charles II block; additions and interiors including the King's bedchamber)

Webb, Philip 1831–1915

British architect and designer

Philip Webb is one of the most interesting figures of the second half of the 19th century. Trained as an architect, he made a careful study of the teachings of Ruskin and Pugin, and received a thorough grounding in the High Victorian neo-Gothic style as an apprentice in the office of George Edmund Street. These influences were augmented by his admiration for the work of his contemporary, William Butterfield, whose use of Gothic was modified by an interest in constructional decoration and vernacular forms. Later in his career, Webb became an early progenitor of the Queen Anne and Old English styles and he sought to create a uniquely English architecture through the combination of the medieval, classical and vernacular traditions. His significance, however, was not simply as an architect. A friend and colleague of William Morris, he shared many of Morris's social and aesthetic views and designed tapestries, glassware, patterns, furniture and stained glass for the Morris firm. They also collaborated upon the design of several notable interiors and, in his most influential schemes, at Standen and Clouds, Webb devised interiors that exemplified the most progressive elements of the Arts and Crafts style.

Webb opened his own architectural office in 1858 and his first commission was to design Morris's new home, the Red House, in Bexleyheath. In the past, this house has often been regarded by architectural historians as signalling the beginning of the modern house. Yet although it has a strongly Gothic feeling, it has long since ceased to be regarded as revolutionary. Its unpretentious red-brick exterior is closely related to the town and country rectories which Webb had worked on under Street, while other details are indebted to the vernacular Gothic style pioneered by Butterfield. Its character is derived from its informal plan, with the principal living rooms sited on the first floor, and from its casual fenestration and its high red tile roofs. The interior, by contrast, was more unusual and achieved an unprecedented synthesis of architecture and decoration. Carefully hand-crafted, it represented a collaborative venture on the part of Morris, Webb, D.G. Rossetti, and Edward Burne-Jones, and included painted decoration, embroidered wall-hangings, stained glass and medievalising painted furniture. Morris and Burne-Jones were primarily responsible for the stained glass and the textiles, Burne-Jones, Rossetti and Morris painted some of the furniture, and all the group contributed to the decorations. Webb's interest in Gothicizing details and revealed construction is evident in the use of uncovered wood lintels and exposed beams, and in the design of areas such as the hall which includes stained glass windows and where huge pinnacled newel-posts rise from the staircase. He also designed much of the furniture, solid and unpretentious like the house itself, and several items, including solid and undecorated bedroom cupboards that are typical of his work, remain in the house.

The most important consequence of the building and decoration of the Red House was the establishment of the firm Morris, Marshall, Faulkner & Co., which was registered on 11 April 1861. Webb was a founding partner and was responsible for much of the company's early furniture and stained glass.

Philip Webb: The Hall, Clouds, Wiltshire, 1904, showing Morris & Co. carpet and tapestry

The roots of the firm lay in a romantic fascination with all things medieval, yet from the beginning of his career, Webb began to move away from Gothic. His quest was to not to find a new style but to develop a non-style. To him, style meant copyism, which he abhorred, and he sought instead to devise an architecture of "timeless Englishness". Decrying fashion, he sought the commonplace and endeavoured to use the innate, rather than the stylistic characteristics of all periods of English architecture as a springboard for the development of an appropriate modern idiom.

During the later 1860s Webb's houses became increasingly compact; symmetry became a more important concern in exterior composition, while inside the central hall emerged as an organizing element around which important rooms were informally arranged. Trevor Hall, Barnet, a small country house of 1868–70, takes the form of an almost square block with three sides that are basically symmetrical. Inside, however, irregularly-shaped rooms are grouped around the hall in an extremely functional arrangement. The convenience and adaptability of the principal living spaces remained Webb's constant concern. This is especially evident in the compact, vertically-organized London studio houses that he designed in 1865 and 1869 for the painters Val Prinsep and G.B. Boyce. The principal rooms are the studios, which are vast, tall spaces filled with light from huge windows divided up into countless small rectangular panes by white-painted glazing bars. Webb

has rediscovered the great walls of glass that had made the living spaces of Elizabethan prodigy houses so liveable.

Webb's use of classical ordering systems was invariably camouflaged by elevational irregularities – openings of various sizes were arranged to admit light where light is needed, gables and dormers enrich the basic forms, and a rich palette of materials is imaginatively composed. These characteristics are all apparent at Standen, Sussex, built for the solicitor James Beale in 1891–94, and the only one of Webb's large country houses that is still intact. By this date, Webb had abandoned any effort to draw elements from historic styles. Instead he turned to vernacular buildings – farmhouses, cottages, and barns in particular – for inspiration. Externally, complexity results from the shape of the roofs and the combination of different materials. The design of the interior reflects many of the same concerns. Gone are the Victorian richness, elaboration and stylistic revivalism that was particularly evident in his town houses of the previous decades, such as 1 Palace Green (1868–73) and 1 Holland Park (1887–88), both London, and increasingly his rooms became lighter and simpler as he limited the extent of ornamental detail. Many of the furnishings at Standen, including the wallpapers and textiles, were provided by the Morris firm, but there is also liberal use of Webb's white-painted panelling and decorative emphasis is concentrated on details such as the panelling of fireplace surrounds. The result is a series of clear, airy rooms that appear virtually undatable and that seem as fresh and modern today as they must have done at the turn of the century.

Webb's work at Clouds in Wiltshire was no less revolutionary. Begun in 1879 and completed in 1886, Clouds was built for the Hon. Percy Wyndham, a leading member of the wealthy, artistic and intellectual group known as the Souls. An unconventional host, Wyndham entertained many of the leading politicians and artists of his day, and his house became celebrated for its informal but high-powered social gatherings. Webb attempted to give architectural expression to this way of life and endeavoured to create a "great house" that was neither pompous nor overlaid with the trimmings that he so disliked. Rejecting the obvious signs of grandeur, he devised a building that looked as if it had been built and added to over the centuries, while inside the decorations were remarkable in being almost free from the overpowering assemblage of patterns that characterized most other schemes of this period. The vast two-storey hall included a large amount of unstained oak panelling and the dominant colour in the main reception rooms was white. Even the decorative details were emphasised only by relief or open patternwork. Touches of colour were provided by Morris & Co. carpets and upholstered chairs, and much of the rest of the furniture consisted of fine 18th-century antiques. The result was a house with large, light interiors whose decoration was strikingly restrained.

Webb and Morris had collaborated on a number of other interior schemes prior to their work at Clouds and Standen. The most important were the Armoury and Tapestry rooms at St. James's Palace, and the Green Dining Room at the South Kensington Museum, both executed in 1866–67, where Webb was in overall charge of the decorations. But perhaps his most significant contribution to the work of the Morris firm lay in his designs for furniture, which were not only extremely varied but also much acclaimed.

Webb's early furniture falls into two distinct categories: sturdy tables and chests made from traditional materials such as oak, and richly decorated cabinets and sideboards executed in stained or ebonised woods. The first owed much to the massive 13th-century Gothic style popularised by medievalists like Butterfield. The second represented the more costly side of the Morris firm's work and included the ebonized and painted settles designed between 1861 and 1865, examples of which were used at Kelmscott House, Hammersmith, and Old Swan House, Chelsea. Webb's later furniture, produced in the 1870s, was simpler and more elegant, including undecorated mahogany tables, cabinets and chairs whose elegant, attenuated forms illustrate a progression to a lighter and more refined style of design. Many of these pieces appear in late Morris & Co. interiors such as Great Tangle Manor, Surrey, and Standen. In addition, Webb also designed several items that became totems of the Arts and Crafts style. His adjustable armchair of 1865, for example, was the prototype of the more famous Morris & Co. chair and its early 20th century progeny as developed by Liberty's, Gustav Stickley, and Charles Sumner Greene. As with much of Webb's other furniture, such pieces emphasise the virtues of handicraft and simplicity of design and, as a result, they defy stylistic classification.

Biography

Philip Speakman Webb. Born in Oxford, 12 January 1831. Apprenticed to the Reading architect John Billing (1816–63), 1849; worked in the offices of George Edmund Street (1824–81), 1854–58, where he met William Morris, and through him Edward Burne-Jones and D.G. Rossetti; established his own architectural practice in London, 1858; designed furniture and decorations from 1858. Joined the newly-founded firm of Morris, Marshall, Faulkner & Co. in 1861 as a designer of furniture, pattern-work and stained glass; appointed consulting manager 1867; retired 1900. Co-founder, with William Morris, Society for the Protection of Ancient Buildings, 1877. Died in Worthing, Sussex, 17 April 1915.

Selected Works

Substantial holdings of Webb's architectural drawings and decorative designs are in the Drawings Collection, Royal Institute of British Architects, London, and the Victoria and Albert Museum, London. Examples of his furniture and stained glass are in the Victoria and Albert Museum; additional items of furniture are in the William Morris Gallery, Walthamstow, and *in situ* at Standen, Sussex and Clouds, Wiltshire. A complete list of his architectural projects appears in Gebhard 1982.

Interiors

- 1859–60 Red House, Bexleyheath, Kent (building, furniture, stained glass): William Morris
- 1864–65 Prinsep House, Holland Park Road, London (building and interiors): Val Prinsep
- 1866–67 Green Dining Room, Victoria and Albert Museum, London (design and decoration with Morris & Co.)
- 1866–67 Armoury and Tapestry Rooms, St. James's Palace, London (design and decoration with Morris & Co.)
- 1868–72 1 Palace Green, London (building and interiors; with Morris & Co.): George Howard
- 1872–76 Rounton Grange, Northallerton, Yorkshire (building and interiors; with Morris & Co.): Sir Isaac Lowthian Bell

- 1877-79 Smeaton Manor, Yorkshire (building and interiors; with Morris & Co.): Major Codman
- 1879-86 Clouds, Salisbury, Wiltshire (building and interiors; with Morris & Co.): Hon. Percy Wyndham
- 1884-91 Great Tangle Manor, Tangle, Surrey (remodelling and interiors; with Morris & Co.): Wickham Flower M.P.
- 1891-94 Standen, near East Grinstead, Sussex (building and interiors; with Morris & Co.): James Beale

Much of Webb's furniture was designed for Morris & Co. from 1861. Notable examples include the *Chaucer* wardrobe (painted by Edward Burne-Jones, 1858), the *St. George's* cabinet (painted by William Morris, 1862), various high-backed "medieval" settles, and a collection of furniture made for Colonel Gillum (1868). He also designed gesso decoration, stained glass, and patterns for Morris & Co; some of his glass designs were produced for his own use by James Powell & Sons of Whitefriars, London.

Further Reading

There is no recent monograph on Webb; the standard biography is Lethaby 1935. Discussions of his furniture, decorative work and interiors appear in general studies of William Morris and the Arts and Crafts Movement. His work at Clouds is documented in Dakers 1993.

Weber, Kem 1889-1963

German-born architect and designer

Born in Berlin and trained under Bruno Paul at the Academy of Applied Arts, Kem Weber was one of a small group of Central Europeans who came to the United States in the first and second decades of the 20th century and did much to establish the popular Art Deco and Streamline Moderne styles. Weber's work encompassed a wide range of activities, including architecture, furniture, interior, graphic and film-set design, and for much of his career he was active in Los Angeles, Santa Barbara and other places on the West Coast.

In 1930 the American Union of Decorative Artists and Craftsmen (AUDAC) held a large-scale exhibition devoted to modern industrial and decorative arts. This exhibition, with its extensive publicity, helped to establish in the public's eye a new profession, that of the industrial designer. One prominent figure represented in this exhibition, and the only individual from the West Coast, was the Los Angeles designer Kem Weber. Weber contributed an entire room to the exhibition which was described by C. Adolph Glassgold as the "most significant" in the exhibition (*Creative Arts*, June 1931, p.437).

Weber's most provocative furniture in this exhibition was his group of *Bentlock* chairs. The unusual feature of these chairs was their joinery which consisted of a thin bentwood joint reinforced by a round ball-like piece of solid wood. The visual effect of this furniture was somewhat similar to the earlier ball joint furniture of Josef Hoffmann, but the curved bending of a thin section of wood at the joint made it possible further to reduce the size of both the joints as well as the vertical and horizontal members of the chair.

Previous to his participation in the AUDAC and several other New York exhibitions Weber had firmly established a nationwide reputation for his own version of the Art Deco (then described as "Art Moderne"). His most widely known pieces of Art Deco furniture were designed for the Modes and Manor Shop of the Los Angeles furniture store, Barker Brothers. Weber's Art Deco furniture of the 1920s was, in its general form, similar in many respects to that of other European émigrés, such as Paul Frankl and Joseph Urban, who had also come to America in the 1910s and 1920s.

It was only at the end of the 1920s and the beginnings of the 1930s that Weber's designs for furniture, especially that of tubular metal and plywood, began to develop a strong and recognizable individual character. Seeing himself from the early 1930s as an industrial designer, he shifted from designs that suggested handicraft to those that suggested machines. Probably his most widely-known machine-image Streamline Moderne designs were the bakelite digital clocks which he designed in 1934 for Lawson Time, Inc. in Los Angeles. These small clocks quickly emerged as icons of the fast moving aerodynamic world of the future, in a fashion similar to the streamline designs of Raymond Loewy, Walter Dorwin Teague and Norman Bel Geddes.

If one thinks in terms of the post-war furniture designs of Charles and Ray Eames and others, Weber clearly (and elegantly) anticipated their use of plastic shells mounted on thin bent metal legs in a number of his pre-1941 designs, such

as the dining chairs he produced for the Bixby house of 1936–37 in Kansas City. Like the Eameses he covered the interior of the reinforced plastic shell of these chairs with a thin upholster rubber pad, and he carefully bent the chrome-plated metal rods so that they would structurally serve as supports for the shell.

The single piece of Weber furniture that continues to be illustrated and written about is his 1934 *Airline* chair. As is often the case with a classic design, the *Airline* chair played a fascinating visual game between reference to the past and exploitation of the new technology of the time, in this case the strong desire in the 1930s for the streamline image. New, easier tooling, plus new glues made it possible to shape structurally thin plywood sheets for the connected seat and back of the chair. The cantilever of the pair of hardwood S-shaped side supports was accomplished by Weber's well-researched exposed and hidden joinery. In a manner reminiscent of a do-it-yourself American Arts and Crafts product of the early 1900s the *Airline* chair came disassembled in a box, and it could easily be put together by anyone using a few common household tools. The do-it-yourself quality of the *Airline* chair emerged as fact but was also an essential part of its final design image.

As to image, Weber strongly hinted at the aerodynamic streamline in the name of the chair, and in its hovering form in which the curved design of each member flowed into and reinforced the other. Though Weber produced over 250 versions of the *Airline* chair, these were all hand-produced. To his regret, he was never able to arrange for its commercial production, as he had been able to do for his *Bentlock*, metal tubular furniture, and other plywood furniture.

Weber's interior designs for domestic, office and retail stores closely reflected the changes that the modern as well as the popular Moderne went through in the decades of the 1920s and 1930s. His Art Deco designs of the 1920s dramatically manipulated layered vertical and horizontal volumes and surfaces, and his applied designs employed the usual zigzag, repeated triangles, stepped arches and parapets, along with strong contrasting colors – deep reds and blues, together with black and silver.

In turning to the Streamline Moderne, in the next decade Weber almost entirely eliminated applied ornament in his interiors, and instead came to rely on insistent horizontality. This approach can be seen in his cabin interior for a private Douglas C-3 (c.1935), the interiors of his Walt Disney Studio buildings in Burbank of 1939–40, and in the horizontal band of windows and built-in furniture for his Wedemeyer house of 1937 in Altadena.

Weber's approach to interior residential design and furniture after World War II was to play down the independent existence of furniture, and also to abandon any references (implied or otherwise) to the machine. As a case in point, the design atmosphere of the David Gray house in Montecito (1953) is that of the expensive, finely detailed cabin of a luxurious wooden yacht. This late work reflects Weber's increased admiration of the concurrent work of other "Warm" West Coast Modernists: William W. Wurster, Harwell H. Harris and others. Today, with our current attachment to High-Tech interior and furniture design, Weber's Streamline designs of the 1930s are what hold our attention. Knowing the rapid

switches in taste, it is possible that in the future Weber's late, woodsy designs may come to hold an even greater fascination for us.

DAVID GEBHARD

Biography

Karl Emanuel Martin (Kem) Weber. Born in Berlin, 14 November 1889. Apprenticed to the Royal Cabinet-maker, Eduard Schultz, Potsdam, 1904; studied at the Academy of Applied Arts, Berlin, under Bruno Paul, 1908–10. Married Erika Forke in Berkeley, California, 1916; two daughters. Worked with Bruno Paul on the design of the German section of the International Exposition, Brussels, 1910; sent to the United States to install the German section of the Panama-Pacific Exposition, San Francisco, 1914; unable to return to Germany after the outbreak of World War I. Active as a designer in America from 1914; established design studio, Santa Barbara, California, 1919; moved to Los Angeles, 1921, and became Art Director of Barker Brothers furniture manufacturers; opened independent design studio, 1927; active as an architect and designer of furniture, graphics, and domestic, office and retail interiors, until 1942; moved studio to Santa Barbara, 1945. Published numerous articles on art and design. Died in Santa Barbara, 31 January 1963.

Selected Works

Weber's office records, including original drawings, sketches, photographs and other documents, are housed in the Architectural Drawings Collection, University Art Museum, University of California, Santa Barbara; the Museum also contains examples of his furniture and metalwork.

Interiors

- 1922 Modes and Manor Shop, Barker Brothers, Los Angeles (interiors and furniture)
- 1926–27 Mayfair Hotel, Los Angeles (interiors and furniture)
- 1927 Mayers Company Offices, Los Angeles (interiors and furniture)
- 1928 Somer and Kaufmann Building, San Francisco (building and interiors; with Albert F. Roller)
- 1928 Bissinger House, San Francisco (interiors and furniture)
- 1936–37 Bixby House, Kansas City, Missouri (building and interiors)
- 1937 Wedemeyer House, Altadena (building and interiors)
- 1939–40 Walt Disney Studios, Burbank (building and interiors)
- 1940 Colburns Fur Store, Los Angeles (building and interiors)
- 1942 Bismarck Hotel, Chicago (interiors and furniture)
- 1945 Kem Weber Studio and House, Santa Barbara (building, interiors and furnishings)
- 1953 Gray House, Montecito (building and interiors)

Weber produced numerous designs for furniture in the 1920s and 1930s including *Bentlock* furniture for Higgins Manufacturing Co., San Francisco, 1928–30, and tubular steel furniture for the Lloyd Manufacturing Co., Menominee, Michigan, 1934; his best-known work was the *Airline* chair of 1934. Other designs were manufactured by several companies including Barker Brothers, Los Angeles, 1921–28; Haskelite Manufacturing Co., Grand Rapids, 1934; Berkey and Fay Furniture Co., Grand Rapids, 1935; Karpen Furniture Company, Chicago, 1936; Mueller Furniture Co., Grand Rapids, 1936; Widdicomb Furniture Company, Grand Rapids, 1936. He designed clocks for the Lawson Clock Co. Ltd., Los Angeles, 1934, and lamps for the Brilliant Glass Co., Weston, West Virginia, 1928.

Josiah Wedgwood and Sons Ltd.

British ceramic manufacturers; established 1759

The ceramic firm of Josiah Wedgwood & Sons Limited, was founded by Josiah Wedgwood I (1730-95) in 1759 at the Ivy House Works, Burslem, Staffordshire. Wedgwood's family had been long established as potters, and he served his apprenticeship with his elder brother Thomas, who had inherited the family works in 1739. In 1754, Wedgwood became a partner of Thomas Wheildon, one of the most notable potters of the period. It was while he worked with Wheildon that Josiah commenced a series of experiments, for the improvement of ceramics, that were to dominate his life. His first achievement was the production of the Green Glaze, but this was superseded by his perfection of cream-coloured earthenware.

In 1766 Josiah purchased 350 acres outside the main pottery conurbation, where he built a new purpose-built factory, which he called Etruria. It was a model for the industry into which he introduced new methods of factory discipline and cost accounting. One of the great advantages of the site was its proximity to the route of the Trent and Mersey Canal (completed in 1777), for which Wedgwood had been a tireless campaigner. In 1769 with the formal opening of Etruria Works, Josiah entered into partnership with his closest friend and confidant, Thomas Bentley (1730-80), a merchant from Liverpool. In the partnership Josiah manufactured the wares and Bentley was the marketeer who sold them. It was an ideal and happy combination. The Etruria factory was used initially

for the production of ornamental wares, the production of his *Useful Queen's Ware* remaining under the guidance of his cousin, Thomas Wedgwood at the Brick House Works, until 1772-73 when the two works were combined.

It was at Etruria that Josiah Wedgwood developed his stoneware body, *Jasper*, to complement the Neo-Classical taste of the period. On the death of Thomas Bentley, Josiah's nephew, Thomas Byerley was sent to London to manage the showrooms. In 1790 Josiah drew up a partnership agreement with his three sons and his nephew constituting a new firm, Wedgwood, Sons & Byerley. Gradually, Josiah retired from the pottery business; he died in 1795. The firm continued initially under the direction of his son, Josiah II (1769-1843) and then under the direction of descendants of the original founder until it became a public company in 1967.

Josiah Wedgwood's ceramics were an integral part of the interior decoration of every important 18th-century house. Probably the best known examples are the architectural plaques manufactured in both Wedgwood terracotta body and, from 1775, his newly perfected *Jasper*. *Jasper* was Wedgwood's most important contribution to ceramic art. The high-fired stoneware body was the result of thousands of experiments. The *Jasper* body could be stained with mineral oxide and was ornamented with bas-relief classical figure subjects. By 1777 Wedgwood was able to manufacture a wide range of ornamental plaques, which coincided with an upsurge of enquiries by architects. Wedgwood commented that he was producing plaques which were, "approv'd of very much and did not doubt that great quantities would be sold to compose chimneypieces". Many of those plaques survive, fitted into fireplaces of houses in Britain and Ireland.

The fashion to create follies led Wedgwood to comment, "Cream colour tiles are much wanted, & the consumption will be great" (5 August 1767). Wedgwood produced a wide range of tiles for dairies, baths and summer houses. Many of these tiles were hand painted in enamel colours while others were transfer-printed by Sadler and Green of Liverpool. Many followed the precedent of Marie Antoinette in constructing her dairy at Le Hameau, Versailles, and by 1769 orders were received for dairy ware. Wedgwood wrote on 17 September; "Lady Gower will build a dairy on purpose to furnish it with cream colour if I will engage to make tiles for the walls". Other eminent people requested ceramics for their dairies, including Warren Hastings at Daylesford House; the Duke of Marlborough; the Duc d'Orléans for his park Le Raincy à l'Anglaise; and the Duke of Bedford at Woburn for whom Henry Holland designed a fantasy Chinese dairy completed in 1794.

Undoubtedly the best preserved and recorded dairy was that created by Henry Holland for Lavinia, Countess of Spencer at Althorp. The single storey building was decorated inside with a wide marble shelf above which were creamware tiles painted with an ivy border round the shelf, windows and frieze. Specific instructions were provided by Lady Spencer as to how pattern 486 was to be painted, ensuring that the design met properly at the corners. For the hand-painted tiles Wedgwood quoted one shilling each, but was cut down to 10 pence, while the Countess paid only three pence for the 1,300 plain tiles she required. A receipt for £36-15-5d dated 3 November 1778 has survived.

The production of tiles ceased about 1800, though a limited number of tiles continued to be produced in the early 19th century. Earthenware tiles and plaque production was reintroduced in 1875, continuing until 1902. During this period a wide range of printed patterns were produced, with designs adapted from the work of Helen J.A. Miles, Colonel Henry Hope Crealock, John Leech's cartoons for *Punch* and Thomas Allen. Other tiles produced included the Marsden Patent Art Tile, encaustic floor tiles and maiolica glazed examples both in relief and made by the *émail ombrant* method.

The architectural and decorative possibilities of the orangery were quickly recognised. Wedgwood found himself manufacturing bricks for his neighbour Mr. Sneyd of Keele, for just such a building. A letter from Sneyd to Wedgwood dated 14 March 1776 reads:

Having a Design to give black (or at least a dark colour'd) Facing to Bricks for a fruit wall, on acct. of imbibing as many rays as possible, it occur'd to me that I could not consult a properer person for ye execution of it than yourself. And you will oblige me greatly by yr. advise ... I shall have no objections to the bricks being coarsely glazed ... for tho' the glazing will reflect ye rays more than I could wish, yet there must be some degree of vitrification on ye surface next to ye Trees to answer another end wch. I wish to bring about, namely preventing ye Bricks from imbibing ye moisture.

Wedgwood replied positively, observing that he had some excellent brick clay which properly treated would be ideal for the orangery.

The newly found interest in gardening, with a wide range of new plant varieties brought back from Continental visits, required an increased variety of containers. Wedgwood was able to cater for the demand for new forms and shapes from hooped garden pots to myrtle pans. The variety of cut flower containers was also extensive, with Josiah providing a detailed breakdown of the individual usage, for example "Vases are furniture for a chimney piece – Bough-pots for a hearth, under a slab or Marble table". The popularity of the library provided Wedgwood with the opportunity to manufacture a wide range of library busts in his fine grained stoneware body, *Black Basalt*. The busts were designed to be placed around the tops of the bookcases. Wedgwood's interest in constantly acquiring new models is best reflected in a letter to his partner Thomas Bentley: "Concerning the busts I suppose those at the Academy are less hackney'd and better in general than the Plaister shops can furnish us with: beside it will sound better to say – This came from the Academy taken from an original in the Gallery of &c. than to say we had it from Flaxman".

The interest in the classical style which developed from the Grand Tour caused Wedgwood to experiment with a method of decoration which he called "Encaustic Enamelling", in direct emulation of the Greek and Roman originals. This new style of decorative vase proved to be extremely popular and Wedgwood was able to draw on many published sources for inspiration for the designs. The close association between Josiah Wedgwood, his partner Thomas Bentley and Sir William Hamilton enabled the manufacturer to borrow, before publication, the drawings by D'Hancarville for the catalogue of Sir William's collection which he had sold to the British Museum.

In a letter from Naples written on 23 May 1786 Sir William acknowledged their achievement: "It is with infinite satisfaction that I reflect upon having been in some measure instrumental in introducing a purer taste of forms and ornaments ... But a Wedgwood and Bentley were necessary to diffuse that taste so universally and it is to their liberal way of thinking and industry that so good a taste prevails". The popularity of these vases was partially due to the Etruscan-style interiors favoured by Robert Adam (1728–92) among other notable architects. It prompted Horace Walpole to comment on the new decor at Osterley House (near London): "The last chamber chills you ... I never saw such a profound tumble into Bathos. It's like going out of a Palace into a Potters field ... Painted all over like Wedgwood's ware with black and yellow small grotesques". One of the best surviving complete sets of Etruscan-painted Wedgwood vases still in existence are those made for the Earl of Shelbourne at Bowood House, near Bath.

Josiah Wedgwood's products for the table are much more widely recognised than those for the actual building or the grounds. His connections with the established landowners meant that he was providing everything in his standard cream-coloured earthenware, called *Queen's Ware* after the patronage of Queen Charlotte from 1765, from kitchen equipment to the most lavish and expensively decorated table services and ornamental items. It became universally accepted that *Queen's Ware* could be used everywhere from palaces to public houses. Josiah described the ware as: "A species of earthenware for the table, quite new in appearance covered with a rich and brilliant glaze, bearing sudden alterations of heat and cold, manufactured with ease and expedition and consequently cheap".

Selected Collections

The largest collection of Wedgwood ceramics is in the Wedgwood Museum, Barlaston. Additional notable collections, including furniture and chimneypieces, in England are in the Victoria and Albert Museum, London, and the Lady Lever Art Gallery, Port Sunlight, Merseyside; the largest collection of Wedgwood in the United States is in the Birmingham Museum, Alabama, with additional holdings in the Metropolitan Museum of Art, New York. Examples of architectural ceramics, or tiles, *in situ* can be seen at Kedleston Hall, Derbyshire, Haddo House, Aberdeenshire, in the Chinese Dairy, Woburn, Bedfordshire, and the Dairy at Althorp, Northamptonshire. Other examples survive at Tsarskoe Selo, St. Petersburg, and Monticello, Virginia.

Wheeler, Candace 1827–1923

American designer of textiles, wallpaper and interiors

At the age of fifty Candace Thurber Wheeler, a self-described “amateur flower painter” and needleworker, undertook a career in design which would make her one of Aestheticism’s most influential proponents in America. Deeply impressed by the Royal School of Art Needlework’s display at the Philadelphia Centennial Exposition (1876), she called upon her society connections in founding the Society of Decorative Art of New York City the following year. Although the Society was primarily intended to provide an outlet for genteel but impoverished ladies’ handiwork, Wheeler insisted upon high artistic standards, hiring many of New York’s leading artists as teachers or judges for exhibitions and sales. In 1879 she resigned to join Louis C. Tiffany, Samuel Colman, and Lockwood de Forest – all of whom had taught for the Society – as a partner and textile specialist in the newly-formed interior design firm Associated Artists. That same year, her embroidered curtain *Consider the Lillies* [sic] of *the Field* earned the Society’s first prize for portière design.

Associated Artists was quickly recognized as the most prestigious and innovative decorating firm in America; the partners’ commission for the decoration of four rooms in the White House (1882–83) was a decisive marker of their status. Because the firm worked collaboratively, it is not always possible to attribute its textile designs to Wheeler alone. For Madison Square Theatre’s massive embroidered and appliquéd drop curtain (1879–80), Wheeler supervised the execution of Tiffany’s adapted design in colors and materials chosen by de Forest and Colman. But lush, richly colored portières, draperies, wall hangings and friezes were essential elements of Associated Artists’ luxurious interiors, and most were of Wheeler’s design. For public rooms, she favored plush, brocade and “cloth of gold” appliqués, lavishly worked with silk thread, and her designs often echoed a room’s theme: her Japanese brocade portière for New York’s 7th Regiment Armory (1881) included images of medieval warfare in

appliquéd velvet and gilded leather, overlapping steel rings to suggest chain mail and a border of “leopardskin” plush. Wheeler’s wall panels could be equally sumptuous: a contemporary account described one such treatment “for a boudoir,” depicting native azaleas in “iridescent” pink, purple and amber plush appliquéd (Harrison, *Woman’s Handiwork*, 1881). For George Kemp’s New York apartment, however, Wheeler created simple, delicately embroidered muslin curtains to hang below Tiffany’s stained-glass transoms. “Appropriateness” – of both imagery and material – was one of her watchwords.

Wheeler’s first attributed wallpaper, complete with dado and frieze, took the grand prize in a national competition sponsored by Warren, Fuller and Co. Her design of clover blossoms, bees, and woven straw hives illustrates her allegiance to naturalistic imagery rather than the conventionalized patterns promoted by Owen Jones and Christopher Dresser. Reviewers noted the modesty of this design, and Wheeler herself wrote about the danger of overwhelming a room with “demanding” wall treatments; walls, she believed, should offer “agreeable,” almost subliminal “sensations of beautiful form” and color. Her fabrics and papers balance the formality of repeat patterning with the graceful idiosyncracies of natural form, and rely on subtle color gradation to suggest light and shadow.

After the original Associated Artists disbanded in 1883, Wheeler used the same name for her own firm, concentrating on textile design for industry as well as studio production. Several of her designs for Cheney Brothers survive in cotton, even indigo denim, reflecting both good business sense and her concern for affordable design. But the firm also had fine fabrics woven to order for grand commissions like damasks for Andrew Carnegie, embroidered with Scottish thistles, or Lily Langtry’s silk bedhangings garlanded with roses. The incredible workmanship maintained by Wheeler’s studio can be judged by two surviving portières (c. 1884) from her own collection (now at the Metropolitan Museum of Art), embellished with repeating patterns of iris and magnolia.

Despite the success of these fabrics, Wheeler wrote wistfully of traditional tapestries, which she considered inappropriate to her time except for studios or “princely homes.” She clearly felt that embroidery and appliquéd on silk or velvet, wallpaper, and stencilling should be considered – in descending order – as substitutes for tapestry, whether for reasons of economy or appropriateness. Pictorial tapestry’s virtue lay in its suggestion of a natural, unlimited horizon, which Wheeler believed diverted one from the reality of being confined within walls. Her hangings for Cornelius Vanderbilt II’s home represent Associated Artists’ first “needle-woven tapestries,” and were received with great acclaim at the National Academy of Design’s Art Loan Exhibition of 1883 (New York). This technique, which Wheeler patented, introduced additional warp threads and embroidery silks into a silk canvas weave. The texture and atmospheric color effects of these hangings are impressive, but their subjects were often rather insipid. The Vanderbilt hangings, for example, include *The Winged Moon*, *The Water Spirit*, *The Flower Girl*, and so on, drawn by Wheeler’s daughter Dora with a conventionally “poetic” sweetness; tapestries depicting Hester Prynne and Minnehaha, among others, appealed to nationalist sentiments. The tapestries were generally lauded in the press – a needle-woven version of Raphael’s *Miraculous Draught of Fishes* was exhib-

ited in the Woman's Building of the Chicago World's Columbian Exposition (1893) and widely praised – and sold well despite their high cost.

Under Wheeler's direction, Associated Artists offered color schemes and plans for rooms or entire houses, and Wheeler wrote extensively about most aspects of home design. Her designs, however, have not survived, and must be inferred from her articles and observers' accounts. Charged with the decoration of a huge library in the Woman's Building at the Columbian Exposition, Wheeler tackled its theme of women's history with relish. Dora Wheeler painted a canvas ceiling mural with figures of Science, Literature and Imagination, busts of noted women – sculpted by women – topped the carved oak bookcases, and light streamed in through leaded glass windows onto green and gold walls. Associated Artists designed the library's chairs, sofas and looped drapery, and Wheeler placed Rookwood pottery and hammered brass throughout. Reviewers (and Wheeler herself) raved about the room's color and light, but their descriptions are frustratingly vague.

In her many articles and books, Wheeler stressed that “the science of beauty” was within the reach of every conscientious homemaker. She considered women's intimate domestic knowledge an advantage in designing interiors, and strongly advocated professional training for women designers – training she never received herself. She laid great emphasis on the proper and intelligent use of color; in *Household Art* (1893), Wheeler described color as “the beneficent angel or the malicious devil of the home,” which if misused could “stir up anger, malice, and all unseen enemies of household comfort.” Her belief that moral issues were at stake lent force to more practical suggestions. She detailed the use of color to link hallways with the outdoors (red to contrast with green trees, or pale pink for a seaside location), tone down the light in sunny rooms (lemon yellow, never gold), or widen or lower a room. Compliance with “the law of gradation” dictated that color should be darkest on the floor, lighter on the walls, and all transitions eased with related tones. A sentimental patriot, Wheeler believed that Americans had a “race-instinct” for color and encouraged the use of American antiques, especially quilts and bedcurtains. She also took a benevolent interest in the decorative aspirations of the American middle class; her *Principles of Home Decoration* (1903) dwelt at length on the use of cheerful but hygienic oil-paint and oilcloth wall treatments for kitchens and servants' rooms. Even the cellar and closets, she wrote, must “share in the thought which makes the genuinely beautiful home and the genuinely perfect life.”

Biography

Born Candace Thurber in Delhi, New York, 1827, the daughter of a farmer. Married Thomas M. Wheeler, 1855: 4 children including textile designer Dora Wheeler Keith. Moved to New York City; settled in Hollis, Long Island, 1854. Visited Philadelphia Centennial Exhibition, 1876; co-founder and vice-president, Society of Decorative Art of New York City, 1877; founded the Women's Exchange, selling crafts and foodstuffs, on Madison Avenue, 1878. Active as an amateur painter and needleworker pre-1876; partner and textile specialist, Associated Artists, from 1879 until the original

partnership was dissolved, 1883; continued to produce textiles under the name of Associated Artists, 1883–1907; Director, Bureau of Applied Arts for State of New York display at the Chicago World's Columbian Exposition, 1893. Designed wallpapers for Warren, Fuller and Co., from 1881; designed silks, embroideries and cottons for Cheney Brothers, Connecticut, from c.1884. Published extensively on textiles and the decorative arts from 1893. Awarded first prize, Society of Decorative Art of New York City Exhibition, 1879. Died in New York, 5 August 1923.

Selected Works

Examples of Wheeler's textiles and wallpapers are in the Mark Twain Memorial, Hartford, Connecticut; Cleveland Museum of Art; and the Metropolitan Museum of Art, New York. Photographs of several Associated Artists' interiors appear in *Artistic Houses* 1883–84.

- 1879 New York Society of Decorative Art Exhibition, New York (*Consider the Lillies of the Field* embroidered hanging)
- 1879–80 Madison Square Theatre, New York (embroidered and appliquéd curtain designed and made by Associated Artists)
- 1880–81 7th Regiment Armory, New York (brocade portière; interiors by Associated Artists)
- 1881 Mark Twain House, Hartford, Connecticut (embroidered textiles and hangings; interiors by Associated Artists)
- 1883 Cornelius Vanderbilt II House, New York (embroidered tapestries and hangings)
- 1893 World's Columbian Exposition, Chicago (decoration and furniture for the library of the Women's Building, and *Miraculous Draught of Fishes* embroidered tapestry)

Whistler, James McNeill 1834–1903

American painter

James McNeill Whistler's concern for harmony of colour and unity of effect informs all his creative work, from paintings and frames to domestic decorations and schemes of exhibition. Reacting against the Victorian predilection for the opulent and the overstuffed, Whistler pared down his interior designs, like his pictorial compositions, to studied arrangements of colour and form, eliminating the details that detracted from aesthetic appreciation.

The formative influence on Whistler's designs was Japanese art, which he began to acquire in 1863 to adorn his own house in Chelsea. Fans, prints, and folding screens figure in many of his paintings of the period, affording a glimpse of what Whistler's mother described as his "artistic abode." Contemporary accounts attest to the novelty of the simply decorated rooms in Whistler's house, conceived primarily as settings for Asian *objets d'art*. Particularly remarkable were the Japanese fans arrayed on the walls – a practice later widely adopted by followers of the Aesthetic Movement. The walls themselves were distempered in tertiary colours: the dining room at 2 Lindsey Row, for instance, was peacock blue, with a greener shade on the dado and doors, to harmonize with his collection of Chinese porcelain – a decorative scheme that prefigured the Peacock Room. The austerity of Whistler's studio can be seen in the background of the works he produced there, such as the famous portraits of his mother and Thomas Carlyle, which show an uncluttered room with grey and black walls, in contrast to what E.W. Godwin called the "overpapered and overpatterned" interiors of the period. Whistler disdained the historicizing tendency of tastemakers such as William Morris: as his biographers Elizabeth and Joseph Pennell observed, he "never tried to live out of his time."

Whistler also designed interiors for his friends and patrons, beginning in 1873 with the reception rooms of W.C. Alexander's residence, Aubrey House. Several of the colour schemes he proposed survive as watercolour sketches in the Hunterian Art Gallery, Glasgow; Whistler once declared that his rooms were "pictures in themselves," and the horizontal bands of colour that make up these plans for wall colours strikingly recall the compositions of his own minimalist seascapes. In 1876, Whistler's leading patron, Frederick R. Leyland, commissioned the artist to decorate the entrance hall of his house at 49 Princes Gate. To enhance the magnificent *ormolu* balustrade that formed its centerpiece, Whistler

painted the upper portion of the walls in "shades of willow," with a darker green wainscoting that set off decorated panels, several of which survive in the Freer Gallery and the Victoria and Albert Museum. These he covered with Dutch-metal leaf, both fixing and coating the squares with a transparent green glaze that he gently abraded so the gold would flicker through; he completed the design with a Japanese-inspired pattern of pink and white morning glories entwined on a trellis. The iridescent panels reminded his contemporaries of "aventurine" lacquer, which glimmers with particles of gold and silver, though Whistler's decoration may owe more of its inspiration to the gilding on Japanese screens.

He would employ the technique of painting patterns on a shimmering ground again in the Leyland dining room, which opened off the hall. It had been designed by Thomas Jeckyll for the display of Leyland's blue-and-white Chinese porcelain and for Whistler's *La Princesse du pays de la porcelaine* (1864–65), the painting that hung above the mantelpiece. Whistler began by making a few minor modifications to the colour scheme, but gradually transformed Jeckyll's interior into a three-dimensional painting of his own entitled *Harmony in Blue and Gold: The Peacock Room* (1876–77). As the most celebrated of his decorations (and the only one extant), the Peacock Room carries Whistler's objectives for aesthetic harmony to a spectacular conclusion. He reduced the colour scheme to the blues, greens, and golds that appear in the plumage of a peacock, and limited the vocabulary of decorative motifs to three distinct feather-patterns, which coalesced in the magnificently plumed peacocks portrayed on the shutters and in the mural opposite *La Princesse*. As in the stair hall, Whistler found inspiration in a variety of Japanese sources but translated the patterns and techniques into a highly original and remarkably coherent artistic composition.

Motivated initially by the desire to harmonize *La Princesse* with its setting, Whistler made the Peacock Room an elaborate extension of the painting's frame; indeed, it was probably his longstanding concern with framing works of art that induced him to gild Jeckyll's spindle shelving so that each piece of porcelain was bordered in gold. In 1878, he collaborated with Godwin on a similar scheme, adorning a mahogany structure called the *Butterfly Cabinet* (in reference both to decorator and the design) with yellow and gold to complement the reddish Kaga porcelain that stood on the shelves. Yellow was one of Whistler's favourite colours for interiors: Mrs. D'Oyly Carte, whose house in Adelphi Terrace Whistler decorated in 1888, recalled that the shade of primrose he selected for the library produced the pleasing illusion of sunshine, "however dark the day".

There are records of decorations proposed for public spaces – the South Kensington Museum, the Boston Public Library, the Savoy Hotel – which, for various reasons, never materialized. Whistler's tastes in interior design did, however, reach a wider audience through the installations he devised for exhibiting his own works in private galleries and later, during his brief tenure as president, for the Society of British Artists. As early as 1874, when Whistler staged his first solo exhibition, critics remarked the "pleasant artist's studio appearance" of the gallery, with its "harmony of colour agreeable to the eye." Every detail of his exhibitions conformed to a colour scheme chosen to suit the works on view – yellow and white, or brown

J.M. Whistler: Peacock Room, 1876

and gold, or flesh colour and grey. It was his ambition, he said, "to prove that the place in which works of art are shown may be as free from 'discordant elements which distract the spectator's attention' as the works themselves."

The lasting influence of Whistler's interiors is difficult to assess, although the principal elements of his style – pale walls, contrasting woodwork, dark polished floors, considerably framed works of art hung few and far between – have survived into the 20th century. The Peacock Room, though commonly regarded as the precursor of Art Nouveau, proved inimitable: by the turn of the century there were vaguely reminiscent Japanesque chambers on both sides of the Atlantic, but the room itself would not be widely known until its installation at the Freer Gallery in 1923, and by then the taste for anything Victorian, even the avant-garde, had reached its lowest ebb. Whistler's most important contribution to Victorian design may have been his conviction that decorative art in general, and interior design in particular, was worthy of an artist's full attention. "For you know," he reminded his friend, the critic Théodore Duret, "I attach just as much importance to my interior decorations as to my paintings."

LINDA MERRILL

Biography

Born James Abbott Whistler in Lowell, Massachusetts, 11 July 1834, the son of Major George Washington Whistler, a civil engineer; used McNeill, his mother's family name, from 1851. Moved with his family to St. Petersburg, Russia, 1843; attended Imperial Academy of Fine Arts, St. Petersburg, 1845–48; Christ Church Hall, Pomfret, Connecticut, 1850–51; entered the United States Military Academy, West Point, New York, 1851 (studied drawing under Robert Weir; discharged 1854). Draughtsman and etcher, US Coastal and Geodetic Survey, Baltimore, 1854–55. Enrolled at the *Ecole Impériale et Spéciale de Dessin*, Paris, 1855; entered the studio of Charles Gleyre (1806–74), 1856. Had one son by Louisa Hanson and one daughter by Maud Franklin; married the painter Beatrice Godwin (née Birnie Philip), widow of the architect E. W. Godwin, 1888 (died 1896). Lived in Paris 1855–59; published his first set of etchings, 1858. Active as a painter in London from 1859; exhibited at the Royal Academy 1860. Travelled to South America 1866. Executed major series of paintings including the *Six Projects* during the 1860s; completed series of *Nocturnes*, 1871–85; involved in interior decoration and the design of furniture, picture frames and exhibitions during the 1870s. Won libel suit against the critic John Ruskin, 1878; declared bankrupt and his home, the White House, repossessed 1879. Travelled to Italy and executed Venice etchings commissioned by the Fine Art Society, 1879–80. Returned to England and active as a painter and etcher in London and Paris from 1880. Published several theoretical papers on art and design including the "Ten O'Clock"

lecture, 1885, and *The Gentle Art of Making Enemies*, 1890. President, Society of British Artists (later Royal Society of British Artists), 1886–88; Chair and President, International Society of Sculptors, Painters and Gravers, 1898. Formed the Company of the Butterfly to sell his work, 1898–1901. Received several awards including Officier, Légion d'Honneur, Paris, 1892; gold medal, World's Columbian Exposition, Chicago, 1893; gold medal, Pennsylvania Academy of Fine Arts, 1902; elected honorary member, Académie des Beaux-Arts, Paris, 1901. Exhibited in Paris, New York and London, including the Royal Academy of Arts, 1860–72, Grosvenor Gallery, 1877–88, Society of British Artists, 1884–88. Died in London, 17 July 1903. Memorial exhibitions, Copley Society, Boston, 1904, Ecole des Beaux-Arts, Paris, 1905.

Selected Works

Major collections of Whistler's paintings, drawings and watercolours, including designs for decorations, are in the Hunterian Art Gallery, University of Glasgow, the Tate Gallery, London, and the Freer Gallery of Art, Smithsonian Institution, Washington, DC. The Peacock Room is now installed in the Freer Gallery of Art. A large collection of archive and manuscript material is in the Centre for Whistler Studies, University of Glasgow.

Interiors

- 1873 Aubrey House, London (decorative schemes): W.C. Alexander
- 1876 49 Princes Gate, London (entrance hall, and Peacock Room decoration in the dining room): F.R. Leyland
- 1878–79 White House, Tite Street, London (interiors and furniture): J.M. Whistler
- 1886 Society of British Artists, London (gallery decorations)
- 1888 Adelphi Terrace, London (decoration including the library): Mrs. D'Oyly Carte

Whistler also collaborated with E.W. Godwin in the design of the *Butterfly Suite* of furnishings (1877–78), produced by William Watt and exhibited at the Paris Exposition Universelle, 1878.

Whistler, Rex 1905–1944

British painter, theatre designer, illustrator and muralist

Painter, designer and illustrator, Rex Whistler played an important role in the revival of domestic mural decoration in Britain in the second quarter of the 20th century. Much of his work was done in private homes, and his skills, along with his wit and charm, were eagerly sought after by a select stratum of fashionable society noted for its artistic and aristocratic associations. Stylistically, he was influenced chiefly by painters such as Claude and Tiepolo, and many of his decorative schemes recalled the extravagance and elegance of German and Italian Baroque and Rococo art. But the key features of his work were a love of fantasy and humour, and he evolved a highly personal style that combined a strong sense of frivolity with a nostalgia for a more polite and decorous age exemplified by the 18th century.

Whistler's talent for drawing was apparent from an early age, and according to his brother and biographer, Laurence, he was drawing ships and steam engines and recording topical events such as the launching and sinking of the *Titanic* from a young age. However, it was not until he enrolled at the Slade

Rex Whistler: "Painted Room", Port Lympne, Kent, 1933–34

School of Art in 1922 that he received any formal training, when he had the good fortune to attract the sympathetic interest of the painter Henry Tonks. The enlightened teaching at the Slade, with its reliance upon drawing directly from the model, benefited Whistler greatly and instilled a new note of discipline into his work. He also benefited from a year's course of architectural lectures given by Sir Albert Richardson at the Bartlett School of Art next door to the Slade. These lectures, together with his exploration of London and its riverside in the company of his friend and fellow-student, Oliver Messel, provided a solid grounding for the sound architectural vocabulary that is evident in much of his work.

As his social circle expanded Whistler became acquainted with a number of potential patrons, including his friend Stephen Tennant. But his real benefactor was Professor Tonks who not only secured his first mural commission to decorate the walls of a boys' club at 293 The Highway, Shadwell, but was also instrumental in obtaining for him the far more important job of painting the interiors of the Tate Gallery Restaurant in 1926. The subject for this commission, based on a fantasy, "Guide to Epicurania", by Edith Olivier, was entitled *Pursuit of Rare Meats* and illustrated courtly scenes of hunting and

feasting set in a distant chivalric past. Despite the whimsicality of the narrative, the mural remains one of Whistler's best-known works and, as essentially student work, it can justifiably be considered a major achievement. The story progresses clockwise around the room and begins with an ingenious corner treatment incorporating an Italianate Renaissance-style town depicted in reverse perspective with the turret of the Ducal Palace placed in the angle of the room. A Corinthian portico and a Gibbsian spire recede towards a hilly landscape which forms the backdrop to the first episodes of the hunt. The predominantly Claudian landscape of the middle distance, occupied with rivers, bridges and inlets, was inspired by the temple gardens of Stowe and includes a ruined Palladian bridge that recalls a similar example at Wilton. On the return journey, the gourmet seekers traverse a land where details, such as the three awkward round-headed windows, introduce an Oriental feel to the glades of Arcadia, and civilization is regained when the "Rare Meats" party is welcomed back to the town by the Mayor.

Additional commissions for decorative schemes quickly followed on from the success of this interior, and a project at Dorneywood, Buckinghamshire (1928–29), where Whistler

created an illusionistic façade of Corinthian columns through which a formal garden can be seen, illustrates his increasing interest in *trompe-l'oeil* effects. This interest was fully developed in his work at Port Lympne, Kent, for Philip Sassoon, where the sophisticated use of painted representations of gathered striped fabric on the ceiling and tasselled scalloped pelmeting recalled the appearance of Regency tent-rooms. A landscape and architectural *capricci* cover the walls, and grisaille trophies and rusticated stonework provide visual stability at the base of the room. The style is still quite whimsical but the handling of paint is more assured and the tricks of perspective and illusionism are carried out with greater confidence.

As well as painting murals, Whistler was also active as a portrait-painter and as a designer of book plates, posters, and illustrations during the late 1920s and 1930s. He was equally successful as a designer of sets and costumes for the theatre and ballet, several of which relate quite closely to his decorative work. A centre-stage Great Door, for example, created for *The Wise Virgins* ballet for the Sadler's Wells Ballet in 1940, illustrates his liking for Baroque styles and created a grand frame for the dancers' tableau. A commission for *The Rake's Progress* (1942) included a well-known architectural act-drop, and the coffered ceilings, wall panels and Corinthian pilasters devised for the staging of Congreve's *Love for Love* (1943) lent a note of splendour to a production whose star-filled cast and extravagance were in marked contrast to the austerity of other wartime productions. Whistler's stage designs were both highly imaginative and technically skilled and bear comparison with the very finest of the period. Only Oliver Messel and John Piper could compete with his achievements in this field, but Piper specialized in almost abstract effects while Messel's work, much closer to Whistler's in general approach, was imbued with more romanticism and less finesse.

Within the sphere of mural decoration Whistler had no rivals. His work in the 1930s included many private commissions in London and elsewhere. Moreover two projects in country houses offered enormous scope for his exceptional talents, providing opportunities for him to compose, organise and execute almost single-handedly (he worked with the help of only one assistant, Vic Bowen), canvases or frescoes on an impressive scale. His unquestioned masterpiece was the dining room at Plas Newydd, Anglesey, painted for the 6th Marquess of Anglesey in 1936–38. Whistler's brief was to decorate a large room in the recently remodelled north wing of the house, and he appears to have had a free hand in composing the design. The main wall, 58 feet long, contained a *capriccio* of mountains, echoing the actual landscape visible through the four windows opposite, great tiers of cloud, hilltop Italian towns, ships and a harbour edged with a grand conglomeration of many of his favourite buildings. *Trompe-l'oeil* colonnades appear on both end walls extending the sweep of the whole scene, and these are enlivened by anecdotal touches that include the family pets on one side and a watchful gardener – a portrait of Whistler himself – sweeping the paving on the other. Perhaps he was keeping a watchful eye on one end of the foreground balustrade where a temporarily discarded crown and trident suggest, like the wet footprints leading on to the carpet, the presence of the sea-god Neptune elsewhere in the house.

The other major mural commission of this period was that for Mrs. Gilbert Russell's sitting room at Mottisfont Abbey of 1938–39. Here, his interest in the romantic styles of the 18th and early 19th century was evident again and he transformed a space even larger than the one he had been working in at Plas Newydd into a 20th-century version of a Gothick parlour replete with pointed arches, trophies, urns and other historical allusions. Unfortunately Mrs. Russell proved to be a difficult client, subject to frequent changes of mind, slow with payments, and quick to complain about the late completion of the work. A painted inscription found many years later on top of the cornice reads "I was painting this Ermine curtain when Britain declared war on the Nazi tyrants. Sunday, September 3rd. R.W.". Shortly afterwards Whistler volunteered for service in the Welsh Guards. He continued to work on a number of stage designs, including sets for Oscar Wilde's *An Ideal Husband*, and he decorated an officers' mess in Brighton with a large painted allegory entitled *The Prince Regent Awakening the Spirit of Brighton* in 1944. Several months after completing this work he was killed leading his troops into their first action, near Caen, in Normandy, on 18 July 1944. His death signalled not only the end of a promising career but also brought to a close the fashion for domestic mural decoration in England in the first half of the 20th century.

ELAINE DENBY

Biography

Born Reginald John Whistler in Summerdown, Essex, 24 June 1905, the son of an architect and estate agent. Educated at Haileybury public school until 1922; studied at the Slade School of Art, London, under Henry Tonks, 1922–26; scholarship, British Academy, Rome, 1928. Awarded the commission to decorate Sir Joseph Duveen's new refreshment room, Tate Gallery, London, 1926. Active as a painter, London, from the early 1920s; involved with book illustration from 1925; executed murals during the late 1920s and 1930s; involved with theatre, ballet and opera set and costume design during the 1930s. Commissioned in the Welsh Guards, 1940. Killed in action, near Caen, Normandy, 18 July 1944.

Selected Works

Examples of Whistler's murals can be seen *in situ* at Plas Newydd, Anglesey, and in the Restaurant at the Tate Gallery, London which also holds examples of his paintings and designs.

Interiors

- 1926–27 Tate Gallery, London (decoration of the restaurant; *Pursuit of Rare Meats* mural)
- 1933–34 Port Lympne, Kent (decoration of the dining room): Philip Sassoon
- 1936 36 Hill Street, London (mural panels for the staircase hall): Mrs. Porcelli
- 1936–38 Plas Newydd, Anglesey (decoration of the dining room): Lord and Lady Anglesey
- 1938–39 Mottisfont Abbey, Hampshire (decoration of the Gothick drawing room): Mrs. Gilbert Russell
- 1944 Officers Mess, 39 Preston Park Avenue, Brighton (allegorical mural; removed to Brighton Pavilion)

Whistler also designed a carpet for Edward James (now at West Dean, Sussex), and a small number of wallpapers, textiles and decorations for ceramics, all in 1932.

Wicker Furniture

Strictly speaking, wicker is a particular form of basket work in which the general shape of the object is produced by a warp of stiff rods. It is usually made from whole or split rods of willow (withy) called osiers, using techniques based on basketry. It is now a generic term that embraces a number of natural materials that have, at various times, been made into furniture by weaving processes. The materials include cane, reed, willow osiers and rattan.

In the East, willow is used as a furniture medium but cane or rattan is far more important. Rattan is derived from a climbing palm found in the East Indies and had been known to furniture-makers for a long time as the source of cane used for chair seats and backs. Cane is simply the pared outer surface of the rattan palm (*Calamus rotang*), while reed is the core of that palm. Whereas cane has been used in furniture since the 1650s for the infill of seats and backs, the reed, or the inner part of the plant, was discarded until the 19th century.

Wicker furniture was known in ancient Egypt from 3,000 BC, while basket-like tub-shaped wickerwork chairs appear on a number of Roman stone reliefs. Without doubt, it remained a useful material for vernacular furniture and was certainly common by the 16th century. John Evelyn mentions the use of willow osiers for all "wicker and twiggie work" in *Sylva*, his work on trees and forests. The establishment of the Company of Basketmakers in the City of London in 1569 is an indication of the growing importance of the trade. During the 17th century, wicker chairs were common all over Europe, sometimes with arms and often with a hooded back to improve stability. Dutch genre paintings of interiors sometimes show the common "bakermat", a special wicker seat designed for nursing, which was made with a long trough in front to allow the swaddling process to be completed easily.

The terms "basket and wicker" became interchangeable in the 16th and 17th centuries. By the 18th century wicker was considered an inferior medium for furniture, but in the 19th century it experienced a massive revival. The heyday of wicker was the Victorian period when furniture was designed both for indoor and outdoor use. Wicker furniture met a very wide range of criteria, thus making it acceptable to various consumer groups. For design reformers, for example, its simple material, which was generally left natural or at most stained, together with its obvious, revealed construction was an important marker of honesty, in terms of both material and style. Rather than being applied to the surface, any ornamental design could be woven into the material and become an integral part of the furniture. From a stylistic point of view, the material lent itself to many varied designs, and it could be decorated as extravagantly as required. More importantly, the public's growing awareness of sanitation and health issues saw wicker as a natural, clean material, synonymous with country living and good health. The associations with baby carriages and invalid chairs perhaps confirm this. Lastly, the growth of a market for furniture designed to be used in a summer setting, either in the garden or in a conservatory, encouraged lightweight, easy-to-handle suites for which rattan was an ideal material. Items were often supplied with loose cushions or in some cases were partially upholstered and fitted with a variety of drapes. Various new models were designed, the croquet chair for example had a wicker frame, a button back, a long seat, a wrap-around back and an integral arm.

In the United States wicker furniture manufacture was industrialised by the Wakefield Rattan Company which later merged with the Heywood Company to create Heywood Wakefield. The story of Cyrus Wakefield and the development of reed furniture is well-known, and from the 1840s there began a massive revival of interest in this sort of furniture. Although very popular in the United States, wicker furniture also enjoyed a vogue all over Europe. Enthusiasm for wicker was strong in Austria and Hungary at the turn of the century, and designers such as Koloman Moser and Richard Riemerschmid supplied designs for rattan furniture. In England Benjamin Fletcher of the Leicester School of Art became interested in German and Austrian initiatives in this area of design. In 1907 he and Harry Peach established the Dryad Company with only a handful of craftsmen. Success soon followed and by 1914 they were employing 200 men. Other manufacturers met the growing demand for less expensive models. Inevitably, attempts at cost reductions in the weaving process led to a change in design from the tightly woven (closed) to the looser, open styles, which in turn may have opened up a gap in the market for inexpensive closely-woven models – a gap that was easily filled by the "man-made material", Lloyd-Loom.

It is clear that the benefits of cane or wicker in furniture-making are that they combine strength and lightness with elements of simplicity and tradition. The wider popularity of these materials coincided with the post-World War II interest in open-plan interiors and the lighter-weight furniture required for them. Examples can be found all over Europe and the United States. In this period three techniques were employed to provide a variety of styles and cost. The first of these was the fully woven, where the warp is the frame; the second where

Wicker, cane and bentwood furniture in the warehouse of Foy & Gibson, Fremantle, Australia, 1870s

thicker canes making a frame were tied together at intervals; and the third where multiple loops of cane were fitted into the frame, tied or pinned to the framework and bound at intervals.

In recent years the popularity of wicker and rattan furniture has grown enormously, no doubt due in part to the combination of lower purchase price, the growth of "conservatory lifestyles", and heavy advertising promotion. Even a straightforward natural material such as rattan has been subject to imitation. In America, during the 1950s, the idea of fabricating a rattan substitute was introduced. The "rattan look" was created from round-section steam-bent wood which was coloured to the tone of cane and charred at intervals to give a natural look.

Lloyd-Loom, although not wicker in a natural sense, was one of the most successful man-made materials for furniture which took its image from wicker. The invention of the process that combined the making of furniture from a (usually) bentwood frame and an integrated surface material is credited to Marshall B. Lloyd. In 1917 he patented a method of weaving a sheet of partly wire-reinforced paper strips, to produce a flexible sheet material that imitated wicker but had its own characteristics. Initially successful in the making of perambulators, it was an even greater success for furniture. In its heyday,

between 1920 and 1940, over one thousand designs were produced by the Lloyd company in the United States and by the British licensee, Lusty.

The use of bentwood frames, which are often hidden behind the woven paper "skin", provided a firm but easily shaped frame to which woven material could be fitted. The importance of this trade, and the fact that before the war one factory was producing more than 300,000 pieces of woven furniture a year, gives an indication of the scale of this branch of the furniture industry. Although used as part of the British Utility range, as well as being produced after the lifting of controls, Lloyd-Loom did not retain its pre-war eminence and it gradually declined as a product range until 1968 when Lusty's closed down.

Although Lloyd-Loom was advertised as "Neither cane nor wicker – superior to either", all these natural materials continue to feature in the home furnisher's repertoire.

Window Shutters and Blinds

Very few windows were curtained before the 17th century, but shutters have been around since the first window openings were cut. Used alone, they kept out wind and weather, the midday sun, curious eyes, thieves and insects – to a degree. Unfortunately, they also blocked out the light. The earliest hinged shutters were side-hung, with only one wooden leaf; like doors, they could be decorated and reinforced with stout iron nails and bands. Paired shutters which met in the window's center were lighter and less awkward, especially when mounted on an interior wall. Interior shutters were usually rectangular, even on arched or irregular windows; to prevent draughts, they could be snugged into a shallow recess surrounding the embrasure.

By the 16th century paired interior shutters were the rule in Europe, often stacked in two to four tiers. Lower tiers could be shut for privacy, or the upper shutters closed against the glare of high noon; wall-mounted iron "shutter dogs" were often used to hold the leaves open. In the Netherlands, where this style held sway longest, the uppermost portion of the window might be curtained or bare rather than shuttered. Two-tiered folding shutters were in use in France by the early 1630s, and by mid-century tall shutters extending the full height of the window were made to fold neatly into a recess in the embrasure or (more rarely) slide into deep pockets within the walls. These were elaborated with fielded panels, paint, and sometimes carving to harmonize with the room's decor: at Fontainebleau the tall sliding shutters in Marie Antoinette's Turkish boudoir were faced with mirrors, completely camouflaging the windows. The most common type had two or three leaves and folded into a shallow recess in the window reveal. In less grand houses folded shutters simply hung parallel to the wall.

Solid wooden shutters blocked views and offered security

and privacy, making them especially useful on the first floor of urban houses. Combined with louvered exterior shutters for ventilation (perhaps as early as 1659 in France) they achieved the best of both worlds. By the late 18th century interior shutters were often made with both louvered and solid panels. Fixed slats were simpler and cheaper to construct, but movable slats – their angle controlled by turning a rod – allowed fine adjustments to the light and air. Louvered interior shutters became nearly universal in southern Europe, America and Australia by 1850, and, until the Victorian mania for drapery set in, were considered elegant enough to stand on their own in summertime. They were rather spare, and could be embellished with shaped valances of wood or tin or short swagged drapes. Green – considered cooling and restful to the eyes – was favored for both shutters and blinds, but after 1850 many household advisers recommended painting shutters to match the walls. This gave pride of place to the drapes, but it was also practical: dark green paint showed dust and was susceptible to fading and water-spots. Folding shutters were impractical for modern picture windows and, after about 1930, much more expensive than mass-marketed venetian blinds. In the 1970s the Victorian revival made them popular again, often stained for a warmer, "natural" look.

Venetian blinds for both interior and exterior use were introduced in Europe some time in the 17th century, and remained in fashion through 1850 or so. In Italy they were often suspended between the pillars of a veranda. Their wooden slats were linked with cloth tape, and raised with a pulley cord; a valance or swag above the blind could disguise the mechanism. As with louvered shutters, a rod controlled the tilt of the slats. Then as now they could be tricky to use, and the uneven quality of early manufactured venetians probably encouraged the Victorian preference for shutters. But they never really disappeared, and the introduction of aluminum slats in the late 1920s gave them a modern, streamlined image: the "House of Tomorrow" at the 1933 Chicago World's Fair had venetian blinds, and Bauhaus expatriates Walter Gropius and Marcel Breuer used them for their Massachusetts homes in 1938-39.

Aluminum venetian blinds were inexpensive and sold in a wide range of colors and sizes. Used alone or tucked behind curtains, they have remained popular into the present, and late 1970s High-Tech design relied heavily on venetians as wall dividers and window treatments. Only minor changes distinguish the newer versions: thin "mini-blind" slats (almost invisible when opened), wood or vinyl instead of aluminum, and safety cords which pull apart under pressure – an innovation which prevents children strangling on the cords. But they still have one major failing: they collect dust. Designed in 1948 to address this problem, vertical blinds were stigmatized as office furnishings before about 1975. Available with metal, plastic or fabric slats, these have gradually come into use for wide expanses of glass in residential interiors.

Wicker and lath window screens are an ancient solution which seem to have been popular worldwide, but linen blinds stretched on frames appear to be an innovation of Renaissance Italy. These were soaked in turpentine or oiled to make them translucent, and sometimes painted with motifs, figures or coats of arms. If made in two hinged sections, they could be propped open. The related "sash blind" appeared in central

Window Shutters and Blinds: French designs for pull-down blinds, c.1880

Europe in the early 17th century, and was sometimes hinged, singly or paired, to the window frame; pleated or gathered fabric was popular for these. Simple roller blinds, weighted at the hem and raised with a cord on a pulley, also date from this period – the short, often tasseled cord at the hem was used only to lower the blind. For privacy, roller blinds could be fixed at the bottom and pulled up, but this interfered with opening the sash. They were usually varnished or painted; landscape “views” were preferred, but Chinoiserie, floral and narrative scenes were later common. Decorative painting also protected wire mesh blinds – available in London by 1735 – against rust.

When the first spring-operated roller blinds (which, unlike modern blinds, were retracted by pulling a cord attached to the spring mechanism) were introduced around 1740 they were quite naturally treated in the same manner. The early versions were expensive novelties: in 1755 Madame de Pompadour received a silk spring-roller blind painted with flowers, hung with silk and gold cords and spangled tassels, and fitted with

copper and brass. Later, illusionistic “Gothic” tracery and stained glass designs enjoyed a brief popularity, and painted imitations of Venetian blinds were a common conceit. But after 1850 fancy painted blinds were considered vulgar unless they disguised a particularly ugly view; plain white or drab linen, taffeta, or figured muslin, possibly with decorous scrolls and borders, were recommended as minor elements behind heavy drapes. Writers stressed that blinds in front rooms, which were visible to passersby, should always be uniform in color (preferably white) and height. Of course, this advice was often ignored. Printed fabrics or even wallpaper held sway in modest homes, green blinds were used to cut glare, and the warm glow of red linen was stylish in the 1870s and 1880s. Festoon or “Austrian” blinds were also popular after 1870; made with yards of silk, these appear fully ruched when unfurled, creating the effect of rich drapery.

Because spring mechanisms were comparatively expensive, the older type of hardware continued to be sold for homemade

blinds until late in the 19th century. (In poorer homes blinds were nailed to the window frame and simply tacked up.) Modern “automatic” spring-roller blinds were introduced in the 1880s. Still, roller blinds were considered convenient rather than stylish until the mid-1950s, when the texture of rattan or wood slats, often woven with nubby yarn, gained cachet. These coarse blinds simply rolled up from the bottom with cord. In the late 1960s and early 1970s, pleated “concertina” or plain roller blinds were often used alone for minimalist elegance. Mylar, cellophane and perforated fiberglass blinds were introduced in the 1970s, but not widely used; quilted and insulated fabric blinds, however, have caught on in energy-conscious households. Festoon blinds made a comeback in the opulent 1980s, along with folded “Roman” fabric blinds, which are soft yet uncluttered. For Postmodern or antique arched and round windows, manufacturers developed fan-shaped pleated or “honeycomb” blinds, and track-mounted blinds can slide along curved or angled skylight and greenhouse windows. Ironically, most late 20th century designers, unlike their Victorian counterparts, enjoy the casual asymmetry of uneven blinds.

Wright, Frank Lloyd 1867–1959

American architect and designer

Frank Lloyd Wright considered interior design a part of a simple system of organic architecture, embodying principles of unity and order and finding its sources for expression in nature. Furniture, interior fittings, interior details, and related, so-called “decorative arts” objects were not to be regarded as merely ornamental adornments to a raw building which, once added, would finish or beautify the space for human use. Rather, Wright embraced the design of interiors as a natural extension of his role as architect, a manifestation of a single vision. Reflecting what the Germans called *Gesamtkunstwerk* (the uniting of the arts), Wright conceived of interior design as a part of architecture, following the same laws and reflecting the same spirit.

Wright expressed his design philosophy in his preface to the famous Wasmuth (1910) publication of his work: “In Organic Architecture then, it is quite impossible to consider the building as one thing, its furnishings another, and its setting and environment still another. The Spirit in which these buildings are conceived sees all these together at work as one thing. All should be studiously foreseen and provided for in the nature of the structure ... The very chairs and tables, cabinets and even musical instruments, where practicable, are of the building itself, never fixtures upon it ...” (Hanks, 1979). Thus, Wright’s houses and public buildings were conceived by the architect as completely integrated environments. Interior design, for Wright, was to be of architecture, not a cosmetic addition to architecture.

One result of Wright’s search for an integration of architectural design and furnishings, in his early work, was an architectonic formal quality which informed early chairs, sofas, and tables, and, consequently, certain home interiors and furniture ensembles. When Wright enlarged his 1889 Oak Park Home in 1895, he converted the original kitchen to a new dining room. Six high vertical slat-backed chairs surrounded a large oak dining room table to form a “room within a room,” a spatial, ritual core for family gatherings at mealtimes; the space was artificially illuminated from above, almost mystically lighted considering that this date was relatively early for electrifying homes. In the 1895 dining room, natural tones were produced by red clay tiles covering floor and hearth and by natural wood, and soft daylight filtered through abstract leaded bay windows at the south end of the room. In all, here was an integrated design, a room in which furnishings helped to define architectural space. Wright, as “interior designer” had considered the whole, coordinating materials, colors, formal and decorative elements, and light to create an interior ensemble; as architect, Wright had composed organic architecture.

Similarly, at the Robie House of 1909 (Chicago), a dining room set formed a self-conscious room-within-a-room. The Robie dining room chair backs employed framed spindles (flat rectilinear vertical slats) from chair crest to floor, a design which in rectangular grouping served to enframe architectonic space. Six chairs positioned around the Robie dining room table joined four corner lamps attached to the table corners to contain the table’s volume within the larger dining room. A similar ensemble of high-backed chairs, dining table, and

Wright: living room, Fallingwater, Bear Run, Pennsylvania, 1936–39

corner lamps attached to the table was made for the Meyer May House (1908, Grand Rapids, Michigan), while other Prairie houses grouped chairs as enclosing frames around dining tables of simpler profile but similar effect.

As well as this architectonic character, these several Wright dining room interiors embodied social ideals echoed throughout the house, most notably ideas of domestic family life. The social theme of gathering together was symbolized by the central position of the hearth and fireplace in Wright's houses as well as by these ritualistic dining room spaces. In general, Wright's coordinated interiors embodied liberal ideals of democratic life, freedom was suggested by open plans, and a simple, natural, artistic life was symbolized by the natural materials of furniture, ornament, fittings, art objects, and architecture.

In traditional terms defining interior design, Wright was a consummate decorative artist. He adorned his early houses and public buildings with sculpture, much of it his own design. Examples include Richard W. Bock's figural frieze at the 1896 Isidore Heller House in Chicago (based on an 1896 graphic design by Wright), the terracotta statue known as the *Figure in*

the Crannied Wall which Bock and Wright designed for the Susan Lawrence Dana House (Springfield, Illinois, 1903), ornament at the 1904 (now razed) Larkin Building in Buffalo (also executed by Bock), and figural sculpture at Midway Gardens (by Bock and Alfonso Iannelli), some of which is preserved in Chicago, although Midway Gardens was demolished in 1929. Moreover, Wright designed office and home furniture, lamps, leaded and stained glass windows and skylights, fabrics for upholstery and wallhangings, place settings and glassware, carpets, murals, vases, and urns. He coordinated these fittings with house interiors marked by natural materials of wood, brick, and stone, and oriented so as to maximize natural lighting, natural siting and orientation, and an ever-present human scale.

In each work, the designer focused both on the inherent beauty of form (the colors, materials, and patterns of the object itself), as well as on the relation of the art object or furnishing to the space it occupies. Each contributed to the architectural unity and natural order of the whole. The intention was to create an organic architecture, a simple, unified synthesis, at different scales, of the man-made with Nature. Wright's deter-

mining theme, in interior design as well as architecture, was organic design.

Thus Wright turned to nature not only to ensure a natural beauty in the forms of his ornament, but also to inspire a natural order as the governing unity of his designs. Much of his ornament – the hollyhock motif at the Aline Barnsdall House (Los Angeles, 1917–20), for example – may be seen as abstracted natural form. Conventionalized flowers or plants were favorite devices for leaded windows in Prairie-era houses. The Dana House in Springfield was elaborately enriched by its extravagant decorative designs derived from the sumac. Wright employed a wisteria fireplace mosaic and “Tree of Life” leaded windows at the Darwin Martin House (Buffalo, 1904) bringing nature into various parts of the house. At such houses (and rarely as extensively as at the Dana House), Wright repeated unifying elements throughout the house in original designs for leaded windows, hanging and built-in lamps, table lamps, and other decorative features. As Wright explained in his essay entitled “In the Cause of Architecture” (March, 1908), such conventionalized plant motifs provided common properties in line and form as a grammar for the architectural expression. “Adhered to throughout,” and “held together in scale and character,” the single idea and derived formal elements of design were aesthetically “cut from one piece of goods.” Moreover, the Martin and Dana ornament, much like contemporary windows Wright designed for the W.R. Heath Residence (Buffalo, 1905), echoed similar conventionalized natural patterns found in native North American Indian arts and crafts. American Indian culture provided design sources Wright is known to have appreciated even before he moved to the southwest desert site of Taliesin West (1930s); he was collecting Navaho blankets, pottery, and other crafts almost from the start of his architectural practice.

Conventionalized plant forms bring an abstraction to the representation of Nature, and Wright’s interiors, in space as well as in decorative fittings, are marked by his interest in geometry. Observable in nature in various forms, geometry brought a sense of unity to the architect’s creations at every scale and was evidenced from the early Prairie period (even the pre-Prairie era of the 1890s) on. But geometry became virtually an obsession for Wright, beginning in the mid 1930s, when it became the basis for the architect’s self-declared “new architecture.” The hexagon evidenced in honeycombs, the spiral forms and channels of shells or shapes of spiral nebula, the triangulations of snowflakes or crystals in varied polygonal combinations – these geometric forms in nature served Wright’s buildings and decorative arts in essentially simple ways.

The roots lie in the earliest period of Wright’s career as a designer. Wright developed the geometrized biological ornament of his mentor Louis Sullivan: compare Sullivan’s ornament at the Wainwright Tomb (St. Louis, 1892) or the contemporary James Charnley House in Chicago of the same year which Wright designed under Sullivan’s employ, with Wright’s interior arcade spandrels at the William Winslow House (River Forest, Illinois, 1893) or his terracotta blocks and entry gate at the Francis Apartments (Chicago, 1895, razed). With more abstracted circles, the architect ornamented windows at the Avery Coonley House Playhouse (Riverside, Illinois, 1912) and composed circles to form his *City by the Sea* mural at Midway

Gardens (Chicago, 1914, razed). The line of evolution continued as Wright positioned similar overlapping circles on the edges of his dinnerware for the Imperial Hotel (Tokyo, 1915–22, razed), created an abstract mural of circles, rectangles, and diamonds, over the Barnsdall House (Los Angeles, 1917) living room fireplace, and designed a living room carpet of floating circles for his son David’s 1952 residence in Phoenix, the house itself an exercise in spiraling arches and circular overlays. When a related house design was developed in 1953 for another son, Robert Llewellyn Wright, the architect coordinated overlapping segmental arches in the house design with similar forms in the furnishings: a coffee table and stools of pointed elliptical shape.

During Wright’s late period (1936–59), when he was employing a T-square, 30 / 60 degree triangle, and compass to experiment with these abstract geometries, triangles and hexagons especially informed his architectural experiments (Paul Hanna “honeycomb” House, Palo Alto, California, 1937, addition 1950, altered 1957). Interiors would reflect this interest, and furniture design employed geometric forms as explicitly as did Wright’s Usonian houses some of which were aggregates of architectural forms and spaces conceived as geometric module and pattern. As an interior designer, Wright sought a wider distribution of his furniture designs during the late period, and he created three separate lines for the Henredon-Heritage Furniture Company. The Henredon furniture projects predictably reflected the architect’s fascination with geometry. The *Four Square* (predominantly rectilinear forms), the *Honeycomb* (triangular shapes), and the *Burberry* (circular shapes) were Wright’s names for the lines; only the first was put into production under Henredon-Heritage’s name, the *Taliesin Line*. It actually combined geometries of all three lines, and often with ornamental mouldings derived from Prairie-era furniture designed a half century earlier by Wright. One Henredon-Heritage suite of six triangular stools (which could double as side tables) could be grouped together to form a single, hexagonal, composite table. Hexagonal tables could be similarly grouped in honeycomb patterns. Derived from hexagonal architectural ensembles, these furnishings were peculiarly Wright.

When such polygonal forms shaped late residential spaces, as in the living room of the Roland Reisley House (Pleasantville, New York, 1951, with addition, 1956), Wright designed built-in shelving with angular ends and hexagonal hassocks, tables, and stools. In the late 1940s he designed an *origami* chair for his living room at Taliesin West employing laminated plywood planes instead of traditional framing of uprights and crosspieces. The chair was upholstered, and houses of Wright’s late period include examples (Seamour Shavin House, Chattanooga, Tennessee, 1950). The *origami* chair’s folded planes and angularity, however abstract, was nevertheless considerably less formal and stiff than his straight-backed early Prairie-era chairs; cushioned inner surfaces were softer, and flaring triangular armrests suggested that the chair was unfolding or opening itself in order to invite one to sit down. Whatever may be the increased comfort level of such a late chair, Wright once admitted that throughout his life he had been black and blue from “a too intimate” association with his own furniture, the *bête noir* of his design efforts.

Wright shared with other modern designers this tendency

toward abstraction, as well as a common effort to coordinate furniture and architectural design. But for Wright's organic houses, any concept of a revolutionary modern "machine" aesthetic was not acceptable: his houses were not abstract architectural volumes enclosed by steel and glass, and so his furniture was not to be hard-edged furniture isolated within a neutral modern space as some *objet d'art*. Despite his early declaration to embrace the machine, Wright maintained, throughout his long career, an essentially humanist and artistic point of view. The artistry and craftsmanship of his early houses are admired by traditionalist and Modernist alike. His greatest steel and concrete residence, Fallingwater, is considered one of the most beautiful modern houses built in this century. In his late Usonian houses, which inspired the ranch house of American suburbia, his built-in upholstered benches, book shelves, and natural lighting invited a comfortable living widely admired. His chairs, while not as uncomfortable as Rietveld's famed *Red and Blue Chair* (or, worse, his zigzag chair), were equally a reflection of a singular architectural ideal identified with its designer. Wright's furniture was recognizably Wright, but in the end, Wright's interior architecture maintained a 19th-century spirit: a Ruskinian tectonic integrity and an artistic sensibility which brought to fruition William Morris's admonition never to furnish your house with anything you do not know to be useful or believe to be beautiful.

While the Henredon line represented an effort to bring Wrightian interior design more into the realm of mass production, it is Wright's craft tradition in the making of buildings and in the fitting out of their interiors by which he remains renowned as America's greatest architect. It is true, Wright began his career in the 1880s just as factory production was beginning to supplant craft production in the furniture industry. His generation asked the question (even more telling as our own generation poses it in the context of computer technology), "Can technology serve art?" Walter Gropius's response at the Bauhaus – well designed yet standardized prototypes intended for factory production and mass consumption – was not the solution Wright would always endorse. But Wright early concluded that the machine was here to stay and that it could be brought into service as an instrument for art. His "Art and Craft of the Machine" lecture (1901) declared his intention to employ the machine, and his designs often reflected his interest in standardizing some motifs, unifying interior ornament, and finding new means by which, through limited mass production, designs might be made available to a wider clientele of consumers.

However, Wright's design foundation as an artist (interior designer or architect) was firmly established in the era of the Arts and Crafts Movement, with its insistence on traditional materials, traditional methods of craft production, and traditional employment of ornament. Indeed, Wright had early served as Secretary of the Chicago Arts and Crafts Society, furnished his own shingle-clad and artsy-craftsy Oak Park house with Stickley furniture, and created in his best Prairie houses Artistic interiors very much in the handicraft spirit. The Arts and Crafts motto, "Art is Life" is embodied throughout his Oak Park house; the craftsman ideal "Truth is Life" is carved above the inglenook fireplace of the living room. If the period before 1910 was Wright's "first golden age" in archi-

tecture, it was also his first golden age in furniture, decorative arts, and interior design.

During the later modern era, when other architects designed furniture in chrome, tubular steel, metal, and plastic, Wright continued to employ traditional wood for his residential furniture. Even his metal office furniture for the Larkin Building (1904) or for the Johnson Administration Building (from 1936) maintained a human scale and sought a functionalism within work environments intended to accommodate worker comfort as well as productivity. In his houses, the scale of Wright's art objects and interiors, his attention to detail, and the quality of design, fabrication, and production in the best of his decorative objects and furnishings, provide constant reminders of Wright's legacy from William Morris: embodied in the art work is the skill of hand and brain, and in this lies its worth; a well-wrought object of craftsmanship is a pleasure to the maker and to the user. Thus, the artist's creative eye and the user's appreciative eye, ensure in Wright's interiors a sense of humanity, a Wrightian Modernism which in the end transcends technology and modern industry. Today, Wright's designs are being reproduced and admired by new generations. The relevance of Wright's legacy to the 21st century, an age of high technology, remains its humanism, its craft spirit, and its organic simplicity and universality, qualities evidenced in Wright's unique coalescence of architecture, artisan craft, and interior design.

Biography

Born in Richland Center, Wisconsin, 8 June 1867. Studied at the Wisconsin School of Engineering, Madison, 1885–87. Married 1) Catherine Lee Tobin, 1889 (separated 1909; subsequently divorced): 6 children including the architect Lloyd Wright; lived with Mrs. Mamah Bortwick Cheney from 1909 (died 1914, in the Taliesin fire); married 2) Miriam Noel, 1915 (separated 1924; died 1927); married 3) Olgivanna Lazovich, 1925: 1 daughter. Junior draughtsman in the office of Allen D. Conover, Madison, 1885–87, and for Lyman Silsbee, Chicago, 1887; assistant architect, 1888–89, and head of planning and design, 1889–93, Adler and Sullivan, Chicago; in partnership with Cecil Corwin, Chicago, 1893–96; in private practice in Oak Park, Illinois, 1896–97, and in Chicago, 1897–1909. Travelled to Europe with Mrs. Cheney and stayed in Fiesole, near Florence, 1909–11. Returned to the United States, built the first Taliesin house and studio, and resumed architectural practice in Spring Green, Wisconsin, 1911; re-opened Chicago office, 1912; Taliesin partially destroyed by fire and rebuilt as Taliesin II, 1914. Established an office in Tokyo while working on the Imperial Hotel, 1915–20. Resumed architectural practice in Wisconsin; Taliesin II partially destroyed by fire and rebuilt as Taliesin III, 1925. Worked in La Jolla, California, 1928; established an office in Chandler, Arizona, 1928–29; founded the Wright Foundation Fellowship at Taliesin, 1932; Taliesin West, Paradise Valley, near Scottsdale, Arizona, built in 1938. Wright continued to practise as an architect in Wisconsin and Arizona until his death in 1959. Designed his first furniture for his Oak Park residence, 1885, and thereafter designed interiors and furnishings for the majority of buildings that he worked on. Wrote and lectured extensively on architecture and design. Received numerous honours and awards including the Gold Medal, Royal Institute of British Architects, 1941, and the Gold Medal, American Institute of Architects, 1949. Died in Phoenix, Arizona, 9 April 1959.

Selected Works

The Frank Lloyd Wright Archives are held by the Frank Lloyd Wright Foundation, Taliesin West, Arizona. The Archives include numerous original drawings and designs, a vast quantity of manuscript material, a numbered list of all Wright's buildings and projects, and a numbered list of his furniture. Additional information is held at the Frank Lloyd Wright Home and Studio Foundation, Oak Park, Illinois. The living room of the Francis W. Little House, Wayzata, Minnesota (1913) is displayed in the Metropolitan Museum of Art, New York, and the office of Edgar J. Kaufmann, Sr. is installed in the Victoria and Albert Museum, London. Examples of Wright's furniture are owned by many major museums throughout the world. They can also be seen *in situ* in Wright houses open to the public: these include the Dona-Thomas House, Los Angeles; Fallingwater, Pennsylvania; the Frank Lloyd Wright Home and Studio, Oak Park, Illinois; the May House, Michigan; the Robie House, Chicago; Taliesin, Wisconsin; and Taliesin West, Arizona. For a complete list of Wright's buildings see Storrer 1978 (and supplements).

Interiors

- 1889–1911 Frank Lloyd Wright House and Studio, Oak Park, Illinois (building, interiors and furniture)
- 1892 Blossom House, Chicago (building, interiors and furniture)
- 1893 Winslow House, River Forest, Illinois (building, interiors and furniture)
- 1895 Moore House, Oak Park, Illinois (building, interiors and furniture; remodelled by Wright after a fire in 1923)
- 1899 Husser House, Chicago (building, interiors and furniture)
- 1900 Bradley House, Kankakee, Illinois (building, interiors and furniture)
- 1902 Heurtley House, Oak Park, Illinois (building, interiors and furniture)
- 1902 Francis W. Little House, Peoria, Illinois (building, interiors and furniture)
- 1903 Dana House, Springfield, Illinois (building, interiors and furniture)
- 1904 Larkin Company Administration Building, Buffalo, New York (building, interiors and furnishings)
- 1904 Martin House, Buffalo, New York (building, interiors and furniture)
- 1905 Glasner House, Glencoe, Illinois (building, interiors and furniture)
- 1908 Isabel Roberts House, River Forest, Illinois (building, interiors and furniture)
- 1908–12 Coonley House and Annexes, Riverside, Illinois (building, interiors and furniture; playhouse annex, interiors and furniture, 1912)
- 1909 Robie House, Chicago (building, interiors and furniture)
- 1911 Taliesin, near Spring Green, Wisconsin (building, interiors and furnishings; major remodellings after fires in 1914 and 1925)
- 1915–22 Imperial Hotel, Tokyo (building, interiors and furnishings)
- 1917–20 Barnsdall House and Annexes, Los Angeles (buildings, interiors and furniture)
- 1921 Jiyu Gakuen School of the Free Spirit, Tokyo (building, interiors and furnishings)
- 1923 Storer House, Los Angeles (building, interiors and furniture)
- 1923 Freeman House, Los Angeles (building, interiors and furniture)
- 1936–46 S.C. Johnson and Son Company Administration Building and Annexes, Racine, Wisconsin (building, interiors and furnishings)
- 1936–39 Fallingwater (Kaufmann House), Bear Run, Pennsylvania (building, interiors and furniture)
- 1937 Edgar J. Kaufmann, Sr. Offices, Pittsburgh (building, interiors and furnishings)
- 1937 Hanna House, Stanford, California (building, interiors and furniture)
- 1937 Jacobs House I, Madison, Wisconsin (building, interiors and furniture)
- 1938 Taliesin West, near Scottsdale, Arizona (building, interiors and furnishings)
- 1940 Pope House, Mount Vernon, Virginia (building, interiors and furniture; moved in 1964)
- 1940 Lewis House, Libertyville, Illinois (building, interiors and furniture)
- 1947 Jacobs House II, Middleton, Wisconsin (building, interiors and furniture)
- 1948 Walters House, Quasqueton, Iowa (building, interiors and furniture)
- 1948–49 Mossberg House, South Bend, Indiana (building, interiors and furniture)
- 1950 Wright House, Phoenix, Arizona (building, interiors and furniture)
- 1952 Zimmerman House, Manchester, New Hampshire (building, interiors and furniture)
- 1952–53 Price House, Bartlesville, Oklahoma (building, interiors and furniture)
- 1953 Wright House, Bethesda, Maryland (building, interiors and furniture)
- 1954 Price House, Paradise Valley, Arizona (building, interiors and furniture)
- 1955 Lovness House, Stillwater, Minnesota (building, furniture and interiors constructed from plans provided by Wright)
- 1955 Rayward House, New Canaan, Connecticut (building, interiors and furniture)

Wright's interiors and most of his furniture were created for specific commissions and were unique. However, some of his domestic wares were commercially produced during the 1950s including his furniture designs for Henredon-Heritage. The plywood furniture for his 1950s Usonian houses was designed to be produced by the house's carpenter or its owner as carried out at the Lovness House (1955), Stillwater, Minnesota. Wright also designed office furnishings, notably for the Larkin Company (1904) and the Johnson Building (1936–46), stained glass, textiles, metalwork and crystal. Reproductions of his earlier furniture designs have been manufactured under Taliesin Foundation licences since the late 1980s by Cassina, textiles and wallpaper by Schumacher, silver and crystal by Tiffany, and stained glass by Oakbrook Esser Studios.

- Letters to Clients*, edited by Bruce Brooks Pfeiffer, 1986

Further Reading

The literature on Wright, and Wright's own writings, are very extensive. For an annotated bibliography of primary and secondary sources see Sweeney 1978. The authoritative study of Wright's career up to 1941 is Hitchcock 1942. An exhaustive recent account of Wright's interiors and furnishings appears in Heinz 1994 which includes numerous archive and new photographs, a list of his furniture designs, and a useful annotated bibliography of the sources most relevant to this subject. A good general survey of Wright's interiors also appears in Lind 1992 which contains a section on the influence of his work among his contemporaries and a list of suppliers of reproductions of his work.

Wyatt, James 1746–1813

British architect

Vilified by A.W.N. Pugin as a “monster of architectural depravity” and the embodiment of “all that is vile, cunning and rascally”, James Wyatt has become known as “Wyatt the Destroyer” on account of his drastic cathedral restorations. His stylistic promiscuity and his constant neglect of his clients – the result of taking on more work than he could possibly handle, and exacerbated by increasing intemperance, has given him a reputation that has overshadowed his achievements as a designer of interiors, furniture and silver.

Although a master of interior design, his work in this field has been neglected by scholars suspicious of his facility and prodigious versatility. James Lees-Milne, for example, considered his Neo-Classical interiors to be only popularising imitations of those of Robert Adam (1728–92); more chaste, perhaps, but also more commercial, for the “average, rather than the exceptional client” as John Harris would have it. John Summerson called him a “stylistic weathercock” who “turned with the breeze of fashion.” But recently his work is beginning to be investigated more seriously.

On his return from six years' study in Italy in 1768 “he found the public taste corrupted by the Adams and he was obliged to comply with it”, he told George III. Yet as a result of his designs for the Pantheon assembly rooms, London (1769–72; destroyed by fire 1792) he became the fashionable domestic architect of his generation at the age of 26. Like much Wyatt work, the interior was considerably more impressive than the exterior. There was an exciting sequence of shaped rooms leading on to a vast domed space, based on the Hagia Sophia of Istanbul as much as the Roman Pantheon. This room was decorated with ornament in the Adam style, and featured antique statues in niches lit with green and purple lights, and *scagliola* columns, supposedly the first use of that

James Wyatt: entrance hall, Heveningham Hall, Suffolk, 1780-84

material in England. The Pantheon captured the imagination of fashionable London, and Walpole was not alone in describing it as "the most beautiful edifice in England".

Wyatt's domestic interiors of the 1770s are more restrained than the often over-elaborate confections produced by Adam in the same decade. Staircases and entrance halls, allowing play with shapes and spaces, are important features of his work. At his first major house, Heaton Hall, near Manchester (c.1772), the imperial staircase fills the centre of the house, with an unusual screen of columns at first floor level. The domed, circular form of the Cupola Room (completed 1775) is based on Adam's unexecuted design for the breakfast room at Kedleston Hall, Derbyshire, where Wyatt's brother Samuel was clerk of the works. It features a repertoire of grotesque ornament, derived from antique sources and contemporary publications such as Thomas Martyn and John Lettice's *Antiquities of Herculanum* (1773), and much delicate gilding. This was contrasted with areas of plain wall with a lightness Adam rarely achieved. A circular Axminster carpet (now lost) echoed the design of the ceiling, while the blinds were painted with designs to match those of the niches opposite.

At Heveningham Hall, Suffolk (c.1780–84), the entrance hall rises through two storeys to a segmental-vaulted ceiling supported by concave fluted groining, with shadows painted in *trompe-l'oeil*. It is an interesting Classic-Gothic synthesis. Behind a screen of Corinthian columns at the ends of the room, and along the south wall, are niches with sculpture, an arrangement that perhaps owes something to Adam's library at Kenwood House, London (1767–69). Instead of the conventional stone colour used for halls, Wyatt chose two shades of green set off with yellow Siena *scagliola* pilasters. The floor, a geometrical arrangement of red and black marble on a stone ground, reflects the pattern of the ceiling; chairs and tables were designed especially for the room to create a completely integrated interior. This is Wyatt's most outstanding and his best surviving work of interior design.

The Island Temple at Fawley Court, Buckinghamshire (1771) is an important but little known Wyatt interior, which Eileen Harris and John Martin Robinson have shown to be the earliest known example of the Etruscan style of interior decoration. Previously the Adams' claim to have invented this style was generally accepted. The temple features pale green walls with painted panels in imitation of antique black and terracotta cameos and tablets. The idea perhaps came from the "Etruscan" and black basalt ceramics, manufactured by Wedgwood from 1768, and recommended by them as particularly suitable for hanging as ornaments in libraries and dressing rooms. Sir William Hamilton's collection of Greek vases, then called "Etruscan", was published in a *Collection of Engravings of Ancient Vases* (4 vols., 1766–70), and was also important for colouring and subject matter. Later, at Heveningham Hall, a small anteroom in the Etruscan style (c.1783) shows Wyatt's increasing restraint in his classical interiors.

From the 1780s Gothic became an increasing part of his work. Humphry Repton recorded that Wyatt was the only architect he knew "who had studied on the Continent, yet preferred the Gothic forms to the Grecian." As surveyor to Westminster Abbey from 1776, and restorer of Lichfield (1788–93), Salisbury (1789–92), Hereford (1788–96),

Durham (1797–1805) and Ely (1800–02) Cathedrals, Wyatt developed an unrivalled knowledge of Gothic architecture. He was at the beginning of the increasingly archaeological tendency of the Gothic Revival in the 19th century, for although his detail was accurate, taken from well-known ecclesiastical sources, he was not academic in its arrangement or in his choice of materials.

A taste for the picturesque underlay his Gothic work, which is now known mainly through contemporary descriptions. Perceiving Lee Priory, Kent (c.1785–90; demolished 1955) as "a child of Strawberry prettier than the parent", Walpole recognised its ancestry in his own house. It had a greater degree of technical mastery but was still a "toy" Gothic, with fan vaulting inspired by the cloisters at Gloucester Cathedral executed in wood on a small scale.

Fonthill Abbey, Wiltshire (1796–1812), built for William Beckford, is one of Wyatt's best known works. Initially intended as a garden folly, but then enlarged with megalomaniac zeal, it was intended to suggest a building added to at different periods, and included accurate Gothic detail appropriate to this effect. The vast scale of the interiors was "sublime" in the sense that Burke defined it, the grand vistas were unimpeded by chandeliers and their effect was exaggerated by a dwarf employed as a doorman. Wyatt aimed at a similar sublime quality in his cathedral restorations. The vibrant colour schemes of Fonthill's interior were disseminated in illustrated accounts of the house, and their influence can be traced in the decoration of many early 19th century houses.

Reflecting his increasing knowledge of medieval sources, the Gothic details at Ashridge Park, Hertfordshire (1808–13) are more accurate than Fonthill. Although it featured a Gothic chapel with spire and a conservatory, apart from the entrance hall these were the only Gothic interiors. Other Gothic work by Wyatt includes remodelling at Windsor Castle, Berkshire (1800–13) and Belvoir Castle, Leicestershire (1801–13).

In his pursuit of an integrated interior, Wyatt designed furniture to echo the decorative repertoire of the room as well as using pieces supplied by commercial manufacturers. In his *Cabinet-Maker's and Upholsterer's Guide* (1826) George Smith praised Wyatt for his influence on "domestic moveables".

IAN DUNGAVELL

Biography

Born in England, 1746, the 6th son of the architect Benjamin Wyatt (1709–72). Married Rachel Lunn, c.1774; 5 children including the architects Benjamin Dean Wyatt and Philip Wyatt. Travelled to Italy and studied architecture in Venice under Antonio Visentini from c.1762. Returned to England and worked in association with the family firm, c.1768. Appointed Surveyor to Westminster Abbey, London, 1776; Architect to the Board of Ordnance, 1782–83; Surveyor-General and Comptroller of the Office of Works, 1796. Member, Royal Academy of Arts, 1785; President, 1805. Member, Society of Antiquaries, 1797. Died in a carriage accident, 4 September 1813; buried in Westminster Abbey.

Selected Works

A large collection of Wyatt's architectural drawings is in the Drawings Collection, Royal Institute of British Architects. An album of ceiling designs is in the Metropolitan Museum of Art, New York; another album containing miscellaneous drawings is in the Victoria

and Albert Museum, London. Details of Wyatt's architectural and decorative commissions appear in Colvin 1995 and Robinson 1979.

Interiors

- 1769–72 The Pantheon, Oxford Street, London (building and interiors with Crace & Sons)
- 1771 Fawley Court, Buckinghamshire (interior decoration and Island Temple): Sambrook Freeman
- 1771–72 Beaudesert, Staffordshire (remodelling of interiors): 1st Earl of Uxbridge
- c.1772 Heaton Hall, Lancashire (building; interiors with Biagio Rebecca): 1st Earl of Wilton
- c.1775 Shardloes, Buckinghamshire (decoration of the library): William Drake
- 1775–76 Milton Abbey, Dorset (decoration of the first floor rooms and bookcases in the library): 1st Lord Milton
- 1776 Belton House, Lincolnshire (alterations and interiors including drawing room and boudoir): 1st Lord Brownlow
- c.1778–80 Curraghmore, Co. Waterford, Ireland (interiors including the dining room, staircase and library): 1st Marquess of Waterford
- 1780–84 Heveningham Hall, Suffolk (interiors, orangery and lodges): Sir Gerard Vanneck
- c.1785–90 Lee Priory, Ickham, Kent (remodelling of building and interiors; library furniture): Thomas Barrett
- 1789–95 Cobham Hall, Kent (alterations and interiors including the Gilt Hall, picture gallery and dining room; Gothic dairy and stables): 4th Earl of Darnley
- 1792–95 Frogmore House, near Windsor, Berkshire (building and interiors): Queen Charlotte
- 1796–1812 Fonthill Abbey, Wiltshire (building and interiors): William Beckford
- 1798–1813 Dodington Park, Gloucestershire (building and interiors): Christopher Codrington
- 1800–13 Windsor Castle, Berkshire (remodelling of royal apartments in Upper Ward): George III
- 1801–13 Belvoir Castle, Leicestershire (remodelling of building and interiors): 5th Duke of Rutland
- 1808–13 Ashridge Park, Hertfordshire (building and interiors; completed by Sir Jeffry Wyatville): 7th Earl of Bridgewater

Wyatt, Matthew Digby 1820–1877

British architect and theorist

Like so many members of the Wyatt family, Matthew Digby was trained as an architect – in his case in the office of his elder brother Thomas Henry (1807–80). But he developed wide interests in colour and decorative design. While still in his teens he "practised etching, lithography and colour", as he himself wrote in some unpublished biographical notes he made for an encyclopaedia. This work, together with some small architectural commissions, enabled him to travel on the Continent for two years from 1844 to 1846, and to bring back around a thousand drawings, of which many still exist in the Drawings Collection of the Royal Institute of British Architects and with present-day members of the Wyatt family. They reveal an observant eye for the minutiae of decoration, a marked feeling for colour and a strong historical bias towards the Middle Ages and, to a lesser degree, the Renaissance.

The most elaborate of these drawings were of mosaics, and Wyatt's first publication was *Specimens of the Geometrical Mosaic of the Middle Ages* (1848) which had a direct influence on the design of Minton tiles; but this unusual interest also brought him to the attention of the Royal Society of Arts, which sent him to Paris, together with Henry Cole and Francis Fuller, in 1849 to report on the Exposition publique des produits de l'industrie française. This led to his being appointed Secretary to the Executive Committee of the Great Exhibition of 1851 and to "superintend the works [and] regulate the accounts". Through Cole, the leading figure behind the Great Exhibition, Wyatt met Owen Jones, the author of *The Grammar of Ornament* and the designer of the colour schemes for Sir Joseph Paxton's exhibition building. This was an important meeting; Wyatt referred to Jones as "my brother in art" and the two were later to become collaborators.

Wyatt also met Isambard Kingdom Brunel, and this led to his being appointed as collaborating architect at Paddington Station, London in 1852. Brunel insisted the decorative iron work should not imitate past decorative styles, a view in line with Wyatt's writings about design which, as Sir Nikolaus Pevsner pointed out, have much in common with the ideas of William Morris which they preceded. Of wallpaper which was intended to cover a wall, Wyatt said it should give an "impress-

sion of flatness", while "a carpet, while it covers the floor, is also the ground from which all the furniture ... are, as it were, to arise; it should therefore be treated as a flat surface and have none of the imitations of raised forms and solid architectural elements so often seen". In 1852 Wyatt wrote *An Attempt to Define the Principles which Should Determine Form in the Decorative Arts*, in which he advocated a Ruskinian "structural fitness" and truth in architecture, in which ornament should be "the offspring of necessity alone". Of his decoration at Paddington, Henry-Russell Hitchcock wrote it was "expressive of the most advanced taste of the 1850s". Certainly it was an attempt to create a unity of design in which the decoration is part of the whole instead of being applied, even if there is a reminiscence of Saracenic architecture. Christian Barman wrote appreciatively of how Wyatt's detailing "flows freely and fluently from the ridge of the great elliptical arches with their six graceful crossings down the long lattice girders to the octagonal pillars of the well-spaced colonnades".

Nevertheless, after the Great Exhibition closed and the decision was taken to re-erect the exhibition building, by then known as the Crystal Palace, at Sydenham, Wyatt became involved in many historical decorative styles when he designed the settings for "the objects by which it should be made interesting and instructive". He and Jones were sent on a commission to "collect works of art from the principal Museums &c of Europe", and then Wyatt "travelled through England to collect casts of medieval sculptures". Finally he created the Pompeian House, the Court of Christian Monuments, the Byzantine, Medieval, Renaissance and Italian Courts in full polychromy; his designs are in the Victoria and Albert Museum Print Room.

Wyatt's architectural commissions included some domestic work, but more importantly Addenbrooke's Hospital, Cambridge (1864) and a Gothic addition to Brunel's Temple Meads Station, Bristol (1865–78). He also designed many buildings in England and in India for the East India Company and the Council of India which succeeded it after the Indian Mutiny in 1857. Following this change a new India Office was built on a site next to that of the Foreign Office in Whitehall. The design was divided between Sir Gilbert Scott, who was responsible for the exterior, and Wyatt for the interior. Nevertheless, the romantic Italianate grouping with its belvedere tower as seen from St. James's Park owes much to Wyatt, as Scott acknowledged, while the former was able to indulge himself in the staircase and important rooms.

The most impressive part of the India Office is the so-called Durbar Court, the central space surrounded by three superimposed arcades in a style derived from the Certosa di Pavia which Wyatt cited as "a truly remarkable school of art". In 1850 he had written the unpublished *Observations on Polychromatic Decoration* (manuscript in the RIBA Library), and in other writings as well as in his watercolours he had shown a great interest in colour in architecture. For Owen Jones's *The Grammar of Ornament* he wrote the texts for the sections on Renaissance and Italian Ornament, which are still crucial references, and now he was able to draw on all this experience in designing the large *cortile* executed in Peterhead red granite, red Mansfield stone and grey Forest of Dean stone for the major elements. Minton made the green and white della Robbia ware, and there are tiles and mosaics coloured blue,

yellow and green. In 1868 the courtyard was glazed so that it could be used for social occasions, as it was for the Durbar of Edward VII when he became King-Emperor. After a long period of neglect this magnificent design has been carefully restored to its original splendour.

Wyatt received many honours, including a knighthood and the Gold Medal of the RIBA, and in 1869 he was appointed the first Slade Professor of Fine Art at Cambridge; the subject of his Slade Lectures was *Fine Art: Its History, Theory, Practice*. He was a prolific writer and lecturer on the decorative and applied arts; Sir Nikolaus Pevsner's 1950 Cambridge Slade Lecture on Wyatt in its published version lists almost fifty publications by Wyatt covering a wide range of topics from mosaics to clocks.

DEREK LINSTRUM

Biography

Born in Rowde, Wiltshire, 28 July 1820, the son of Matthew Wyatt II (1773–1831) and brother of the architect Thomas Henry Wyatt (1807–80). Trained in his brother's office; enrolled in the Royal Academy Schools, 1837. Travelled in France, Italy, Sicily and Germany, 1844–46. Practised as an architect from 1846; designed tiles from 1850, and subsequently carpets, wallpapers and metalwork. Superintending architect of the Crystal Palace at Sydenham, London, 1852; Surveyor to the East India Company from 1855; first Slade Professor of Fine Art, Cambridge University, 1869–72. Published extensively on ornament and design from the 1850s, including *The Industrial Arts of the Nineteenth Century*, 1851–53. Received many honours including Chevalier, Légion d'honneur, Paris, 1855; elected Associate of the Royal Institute of British Architects, 1849; Fellow, 1854, Vice-President and Royal Gold Medallist, 1866; knighted 1869. Died at Cowbridge, Glamorganshire, 21 May 1877.

Selected Works

Collections of Wyatt's architectural drawings and decorative designs are in the Victoria and Albert Museum and the Drawings Collection, Royal Institute of British Architecture. Drawings relating to his work at Alford House and Compton Wyngates are in the Cooper-Hewitt Museum and the Metropolitan Museum of Art, New York. A list of Wyatt's architectural commissions appears in Robinson 1979.

Interiors

- 1850–55 Paddington Station, London (architectural decoration, with Isambard Kingdom Brunel and Owen Jones): Great Western Railway
- 1852–54 Crystal Palace, Sydenham (with Joseph Paxton and Owen Jones; including Pompeian, Byzantine, Medieval, Renaissance and Italian Courts)
- c.1857 Northampton House, Piccadilly (saloon and conservatory): 3rd Marquess of Northampton
- 1859–63 The Ham, Glamorgan (building and interiors): Rev. Iltyd Nicholl
- 1864 Addenbrooke's Hospital, Cambridge (building and interiors)
- 1864 12 Kensington Palace Gardens (library and billiard room): Alexander Collie
- 1865–78 Temple Meads Station, Bristol (engine-shed, offices and refreshment rooms): Great Western Railway
- 1866–68 Possingworth Manor, Sussex (building and interiors): Sir Louis Huth
- 1868 India Office, Whitehall, London (with George Gilbert Scott; interiors including the Italian Renaissance Court): Council of India
- 1871 Alford House, Ennismore Gardens, London (building and interiors): Lady Marion Alford

Designs for tiles for Maw & Co.; carpets for Templeton & Co.; wallpapers for Woollams & Co. and Hurrell, James & Co.

Wyatville, Jeffry 1766–1840

British architect and furniture designer

A quintessential architect of the Regency period, Jeffry Wyattville trained in the office of his uncle, James Wyatt, and then set up in practice, at first in partnership with a builder, in 1799. He was a fine draughtsman and watercolourist, and like most of his contemporaries he was able to turn his hand to all the fashionable styles of architecture and decoration. He gained a reputation as an improver of country houses, and he was adept at extending and remodelling. From 1804 until his death he occupied 49 (now 39) Brook Street as his London home and office; this building has more recently been better known as the showroom of the interior decorators, Colefax and Fowler, and Wyattville's splendid first-floor Gallery has often been illustrated in its redecorated appearance as Nancy Lancaster's drawing room.

Wyatville's first important commission was a stylistic innovation. In 1800 he was consulted by the 2nd Marquess of Bath about extensive additions and internal improvements at Longleat, Wiltshire. The result was a pioneering venture in Elizabethan Revival architecture and decoration which was still being admired as late as 1871 when Robert Kerr thought "so successful a work of conversion is seldom to be seen". The Great Hall was retained virtually intact, but the circulation was greatly improved by the construction of a grand staircase,

vaguely 17th-century in style and with strapwork panels in the balustrade. The very comfortable Green Library has a compartmented ceiling in Elizabethan style, although the bookcases and chimneypiece are classical. Most of the rest of Wyattville's interiors were destroyed between 1876 and 1882 when John Crace redecorated them.

Wyatville's early work in the Gothic style included a small house, Hillfield Lodge (now Hillfield Castle), Hertfordshire, which has an octagonal Breakfast Room with a vaulted ceiling and a Gothic conservatory; but most of his early works were austere Neo-Classical in the Wyatt family manner (e.g., Woolley Park, Berkshire c.1799, Hyde Hall, Hertfordshire c.1803) and the decoration of the rooms is conventional and, on the whole, minimal.

An unusual excursion into the Reptonian Picturesque style was the 6th Duke of Bedford's cottage orné, Endsleigh in Devon. The relatively small rooms were decorated and furnished by Wyattville. In the Dining Room he used oak-grained panelling and *trompe-l'oeil* Gothic tracery, while the Library is plainly panelled with brass-latticed, glazed bookcases and small copies of classical statues. Drawings survive of designs for dining chairs in a "Jacobean" style. Wyattville also designed some of the Tudor-Gothic furniture for Ashridge Park, Hertfordshire, which had been under construction to James Wyatt's design from 1808 until his death in 1813. His nephew then took over, but he added a considerable amount of building to east and west of the elder Wyatt's house, so giving the whole a more Picturesque effect. Internally, his finest work is in the Chapel, for which he made carefully detailed drawings of the woodwork, including elaborate stalls for the 7th Earl and Countess of Bridgewater, which show his command of the Gothic style.

The Neo-Classical houses of the second decade of the 19th century included Dinton Park, Wiltshire for William Wyndham (1812–17) and Bretton Hall, Yorkshire for Col. Beaumont (c.1811–14). Both have fine interiors. The staircase in the former is typical of the late Wyatt style with blind and open arcades of yellow *scagliola* Ionic columns, crowned by a shallow dome and pendentives. Wyattville's additions to Bretton include a brilliant dramatic stroke in the Vestibule; yellow *scagliola* Doric columns support the upper walls which are decorated on three sides with large Roman ruin paintings by Agostino Aglio, and above is a glazed lantern with heraldic glass. The fourth side opens up through a gigantic arch onto the staircase. The new rooms were the Library, Dining Room and Music Room, the last being decorated by Aglio with grisaille musical trophies. Another dramatic effect was created at Woburn Abbey, Bedfordshire (1816) where Wyattville designed the Temple of the Graces for the 6th Duke of Bedford to contain Canova's famous group, recently acquired by the Victoria and Albert Museum, London. Bronze-mounted mahogany doors at the end of the Sculpture Gallery opened to disclose a circular temple with yellow *scagliola* walls and a white and gold coffered dome, from which light entered through an oculus to illuminate the white marble figures which stood on a sculptured pedestal.

Wyatville's career took a new turn when his reputation as an improver led to an invitation in 1818 to extend and alter Chatsworth for the 6th Duke of Devonshire. He was working there until 1834, improving the circulation in the house, which

meant alterations in the Entrance Hall and the Painted Hall, and the insertion of a new staircase. More important was the creation of the present Library out of the old Gallery. In this room, as in some others at Chatsworth, he retained the original painted ceilings, devising complementary plasterwork where necessary. The result is the perfect image of a country-house library, rich and comfortable. Wyattville also designed a suite of State Apartments (the 6th Duke disliked those of his ancestor) in the new north wing, which are among the finest interiors of the time. The Cabinet Library magnificently forms the link between old and new, introducing the sequence of rooms, the segmentally-vaulted Dining Room, the Sculpture Gallery with its famous Antique and Neo-Classical collection (displayed originally against the cream-coloured stone walls), the Conservatory, and finally the Theatre which is crowned by an open belvedere.

The climax of Wyattville's career came in 1824 when his reputation as an architectural improver, and probably a recommendation from the Duke of Devonshire to George IV, brought him the commission to improve Windsor Castle. He himself was more interested in the exterior, considering "internal decoration as something of a comparatively temporary nature, liable to change with the fluctuations of taste, or new doctrines of convenience". The king had his own ideas about decoration and taste, and Wyattville's work reflects the royal eclecticism. The new St. George's Hall and the Guard Chamber were Gothic, but most of the other rooms followed the king's inclination towards 18th-century French taste. The State Reception Room, the most French of all these interiors, incorporated woodwork removed from the demolished Carlton House, and was a brilliant pastiche with its white and gold *boiseries*, mirrors, tapestries and chandeliers. The Private Apartments were also strongly influenced by French precedent. There were some exceptions; the Private Dining Room was Gothic and the work of the young A. W. N. Pugin who also designed Gothic furniture (which he later repudiated as "a complete burlesque") for St. George's Hall. The new Gallery, which was built to improve circulation with the Castle, is also Tudor-Gothic, although only the ceiling shows as the walls are covered with a part of the Royal Collection; and the Waterloo Chamber, made to contain Sir Thomas Lawrence's portraits of the Allied monarchs, statesmen and soldiers who had combined to defeat Napoleon, is vaguely Caroline in style since decoration by Grinling Gibbons was reused.

Wyatville survived into Victoria's reign, living in the Winchester Tower which was his official Windsor residence. He died in 1840 and is buried in St. George's Chapel.

DEREK LINSTRUM

Biography

Born Jeffrey Wyatt in Burton on Trent, Staffordshire, 3 August 1766; used name Wyattville from 1824. A member of the Wyatt dynasty: son of the mason Joseph Wyatt, nephew of the architects James (1746–1813) and Samuel (1737–1807). Married Sophia Powell c.1799; 1 son and 2 daughters. Apprenticed to Samuel Wyatt, London, c.1784–91. Worked under James Wyatt, 1792–99; in partnership with the John Armstrong, 1799; established his own firm, London, 1803. Appointed architect to George IV, 1824; knighted, 1828. Exhibited regularly at the Royal Academy of Arts from 1786; elected an Associate, 1822; member 1824. Fellow, Royal Society, and

Antiquarian Society. Died in London, 18 February 1840; buried in the crypt of St. George's Chapel, Windsor.

Selected Works

A detailed catalogue of Wyattville's architectural projects and interior work is included in Linstrum 1972. Examples of Wyattville's drawings and designs are in the British Museum; the Drawings Collection, Royal Institute of British Architects, London; and the Royal Library, Windsor. Additional drawings and manuscript material is in Devonshire Collection, Chatsworth; the Collection of the Marquess of Bath, Longleat; the Collection of the Duke of Bedford, Woburn; and the Mr. and Mrs. Paul Mellon Collection, Virginia.

Interiors

- c.1799 Woolley Park, Berkshire (alterations, and remodelling of interiors): Rev. Philip Wroughton
- c.1800–13 Longleat House, Wiltshire (alterations and additions to the house; extensive remodelling of the interior including the Saloon, upper Dining Room, staircase and Green Library): 2nd Marquess of Bath
- c.1803–06 Hyde Hall, near Sawbridge, Hertfordshire (addition, and remodelling of interiors): 2nd Earl of Roden
- c.1805 Browsholme Hall, Yorkshire (decoration and furnishing of new gallery): Thomas Lister Parker
- 1809–11 Badminton House, Gloucestershire (alterations, and remodelling of interiors including the Library and Drawing Room): 6th Duke of Beaufort
- 1810–16 Cottage Orn , Endsleigh, Devon (building and interiors, including much of the furniture): 6th Duke of Beaufort
- c.1811–14 Bretton Hall, Yorkshire (additions and interiors including the Vestibule, Library, Dining Room, and Music Room): Col. Thomas Richard Beaumont
- 1812–17 Dinton Park, Wiltshire (building and interiors): William Wyndham
- 1812–19 Towneley Hall, Lancashire (alterations, and remodelling of interiors): Peregrine Towneley
- 1814–17 Ashridge Park, Hertfordshire (completion of the building by James Wyatt; furniture and decoration of parts of the interior including the Chapel): 7th Earl of Bridgewater
- 1816 Woburn Abbey, Bedfordshire (sculpture gallery): 6th Duke of Bedford
- 1818–34 Chatsworth House, Derbyshire (alterations and additions to the house and estate; decoration of interiors including the Library, Dining Room, Music Gallery, Sculpture Gallery, Conservatory, Theatre and Dairy): 6th Duke of Devonshire
- 1821–23 49 Lower Brook Street, London (remodelling of the house and interiors): Jeffrey Wyattville
- 1824–40 Windsor Castle, Berkshire (remodelling of exterior and interiors including St. George's Hall, State Reception Room, Waterloo Chamber and private apartments): George IV
- 1826–30 Lillieshall Hall, Shropshire (building and interiors): Lord Gower
- 1832 & Kensington Palace, London (alterations to Duchess of Kent and Princess Victoria's Apartments): William IV
- 1836 Cadland, Hampshire (additions, and remodelling of interiors): Andrew Robert Drummond

Zimmermann, Johann Baptist 1680–1758

German stuccoist, fresco painter and architect

Born the son of a mason and stuccoist in Gaispoint, near Wessobrunn, Bavaria, Johann Baptist Zimmermann was the elder brother of the stuccoist and architect Dominikus Zimmermann. Both brothers trained at the Abbey of Wessobrunn and also under the leading architect and stuccoist Johann Schmuzer. Johann Baptist also worked as a painter and he executed frescoes in several of his brother's churches, including the Wallfahrtskirche Steinhausen, near Biberach in Württemberg, and the Pilgrimage Chapel at Die Wies. Much of the Zimmermann's finest and best-known work was for ecclesiastical commissions, but Johann Baptist also contributed some outstanding stucco decoration to a number of important secular buildings.

Stucco decoration played a significant role in interior design in South Germany during the 18th century. The interiors created by the architects Joseph Effner and François Cuvilliés in collaboration with J.B. Zimmermann for the Electoral court at Munich were especially important, and differed stylistically from both French models and from the interior decoration at other German courts.

Many older histories of this period assume that Effner and Cuvilliés were responsible for every detail of their interiors, and that the stucco artist simply executed their designs. More recently, however, research into Zimmermann's work as a whole suggests that he had considerable scope to realize his own ideas and that he exercised a decisive influence on the creation of interior schemes.

One of Zimmermann's earliest secular commissions was for stucco decoration in the Benedictine abbey of Ottobeuren built in 1711, where he worked in many rooms including the central hall of the summer abbey. Because of the greenish stuccoed marble pilasters that ordered its walls and the textile furnishings with green curtains and portières (destroyed), this room was called the "Green Hall". The social position of the monastery, whose abbot was a secular sovereign as well as a religious prelate, is reflected in the design of the Hall as a worldly function room. While the view through the windows is onto the garden and the mountainous landscape beyond, the surfaces of the walls between the pilasters are filled with high, narrow stucco reliefs depicting allegories of virtue, standing

like garden figures on ornamental plinth in front of backdrops of trees. The turquoise-green background of the reliefs was restored during the renovation of the room in 1964. There are echoes of Zimmermann's fresco painting, in which the constellation of landscape and figure likewise plays a central role. And the inclusion of nature in the decoration – the fusion of interior and exterior space – which was later to become a decisive element in Cuvilliés's designs, could have its roots here.

Zimmermann was probably brought to the attention of the Munich court by the Venetian fresco painter Jacopo Amigoni, who had also worked in Ottobeuren. After the Elector Max Emmanuel's return from his French exile, a great deal of building took place, focusing chiefly on the extension and furnishing of the Neue Schloss at Schleissheim. The architect Effner, who had received his training in France, agreed a contract with Zimmermann in 1720 for the stuccoing of the formal, three-storey stairwell, and all of the details were precisely stated. In spite of this, the finished work represents not only a technical, but also an artistic achievement. It can be presumed that Zimmermann received this commission because of his expertise as a sculptor of figures, an expertise with which he had already distinguished himself in Ottobeuren. In the Schleissheim stairwell, the figures of the genii of victory with the electoral coat of arms above the ledge of the main floor and the putti represent the culmination of the decoration. In the adjoining White Hall, the figural elements – putti with garlands of fruit over the door pediments and putti with outspread drapes on the narrow sides of the Hall – are increased, a development which is echoed in Amigoni's large ceiling fresco. And although ornamental forms from the French Regency had previously barely featured in Zimmermann's formal repertoire, they now come to the fore through Effner's influence, particularly in the smaller, less formal rooms. In the South Antechamber of the Neue Schloss, the surfaces of the walls between the door and the window openings are covered with stuccoed ornamental fields which are based on engravings by Jean Berain. Relief medallions with pastoral landscapes are introduced into this system of interlaced grotesques as the stucco artist's own invention. In the Stucco Cabinet, the Blue Cabinet and the Chamber Chapel at Schleissheim, the French Regency decorative system – which is mostly enriched and accentuated with allegorical figures – develops towards an ever greater subtlety, an impression which is heightened by the gilding of the stucco work.

Zimmermann: Hall of Mirrors, Amalienburg Pavilion, Nymphenburg, 1734–39

In 1728 Cuvilliés was appointed the court's master builder by the Elector Karl Albrecht. Cuvilliés had also studied in France but, in contrast to Effner, he represented a style which introduced the early Rococo into the Munich court. In the Reichen Zimmer (Rich Rooms or state apartments) of the Munich Residenz, the wall panelling, the furnishings and the stucco decoration form a stylistic unity. In most of the rooms the wood carvings and the stucco decoration are gilded so that they stand out against the white background. The ceiling's iconographic programme, which alludes to the times of day, the Arts and the virtues of the ruler, is executed as a stucco

relief. Here too Zimmermann proved himself as a collaborator. The figural scenes are surrounded by landscape motifs. In the Elector's bedroom the moon, the stars and the flying owls suggest the night sky. Such pictorial scenes, which despite their asymmetry achieve a balance, could be found in France in the engraved work of Antoine Watteau but were not evident in the ceiling stuccoes of contemporary French interiors. The novelty of the design of the Reichen Zimmer was immediately noticed by architects at other German courts. The Bamberg prince-bishop's architect, Johann Jakob Michael Kuchel, who had seen the Reichen Zimmer shortly before their completion,

wrote in his travel diary that there was nothing more beautiful or more tasteful in the world. Leopoldo Retti, the building director at the Ansbach court, had sketch plans made of the Reichen Zimmer in 1738 as patterns for the furnishing of the Margravian living rooms at the Ansbach Residence. Unfortunately, the subtlety of the stuccoes in the Reichen Zimmer can only be experienced today through the medium of reproductions. The ceilings were largely destroyed in 1944 and reconstructed in 1957–58.

The Amalienburg, a summer residence and hunting lodge in the Nymphenburg Park (1734–39), represents the apotheosis of Cuvilliés's, Zimmermann's and the court sculptor Johann Joachim Dietrich's skills. At the centre of the building is a round hall with a cupola, which is adjoined on both sides by two rooms and two corner closets. The rooms differ in colour and decoration, and a heightening of effect towards the centre of the building is intended. The silvering of the stuccoes throughout forms a linking element between the rooms. In the closets, the ornamental stucco works are on a pale blue ground. French Regency motifs, early *rocaille* ornaments and plant forms create a system of accents in flat relief. In the adjoining rooms with their whitish tinted ceilings and yellow walls, landscape motifs with putti and mythological figures emerge out of the decorative composition. The relief is more strongly developed. In the domed hall, which can be regarded as one of the most beautiful 18th-century interiors in Germany, the stucco decoration has achieved the greatest possible freedom, and yet remains subordinated to the rhythm of the space. The walls are broken up by mirrors, windows and doorways. The borders between interior and exterior space have been done away with. Both the stuccoed musical instruments and tableware on the tops of the mirrors and the figures above the moulding – which is curved in rhythm with the ordering of the walls – recall the room's function as a banqueting hall and a ballroom. The almost free-standing figures of the nature gods Diana, Amphitrite, Ceres and Pomona, and putti with magnificent drinking vessels, sit under towering trees. Birds flying up above the scene scarcely seem to touch the pale blue shell of the cupola. It can be presumed that the idea of reinterpreting the cupola as a vault of heaven bounded by a landscape space filled with figures owes its development to the mutual influence between the architect and the stucco artist.

Zimmermann's last major commission at the Munich court was the alteration of the Stone Hall in the Middle Pavilion of Schloss Nymphenburg. In 1755–57, the early 18th-century hall was decorated in a Rococo manner. Zimmermann himself was evidently responsible to a large extent for the design of the two-storey main hall. The large, brightly-coloured ceiling fresco with its depiction of the Olympian gods, surrounded by partially gilded *rocaille* ornaments, are reminiscent – as are the similarly formed wall frescoes and overdoors – of the furnishings at Schäftlarn Monastery that had been created a short while before. In contrast, Cuvilliés's own archivally-authenticated influence makes itself felt in the garden room behind the main hall. A straightness in the borders to the white fields of the walls and a reduction in the amount of decoration suggests a move away from the native Rococo style and a return to French models.

Biography

Born near Wessobrunn, Bavaria; baptized 3 January 1680; the son of the stuccoist Elias Zimmermann (1656–95), and the brother of the architect and stuccoist Dominikus Zimmermann (1685–1766). Apprenticed as a stuccoist in the stucco workshops in the abbey of Wessobrunn. Married 1) Elisabeth Ostermayr, 1705 (died 1756); 2 sons, Johann Joseph and Franz Michael, and 2 daughters; 2) Maria Christina Mansrieder, 1756. Mainly involved in ecclesiastical commissions until 1720; worked as a stuccoist under the architect Joseph Effner, at the Neue Schloss, Schleissheim, 1720–26; court stuccoist, Munich, from c.1727 and worked on various court buildings intermittently, 1730–57. Designed frescoes and stuccowork for numerous churches and cloisters; collaborated with his brother, Dominikus, at Wallfahrtskirche, Steinhausen, 1727–33, and Wies, 1745–57. Buried in St. Peter's Cemetery, Munich, 2 March 1758.

Selected Works

Interiors

- 1715 Schloss, Maxlrain (Apollozimmer)
- 1716–17 Abbey, Ottobeuren, (Grüner Saal and Empfangssaal)
- 1720–c.26 Neue Schloss, Schleissheim (interiors including the Great Hall and stairs; building by Joseph Effner)
- 1724–27 Preysing Palace, Munich (interiors; building by Joseph Effner)
- 1726–30 Residenz, Munich (Ahnengalerie)
- 1729 Residenz, Munich (Vorzimmer and Äusseres Audienzzimmer der Reichen Zimmer)
- 1730 Residenz, Munich (Schatzkammer including Porzellankabinett)
- 1731–33 Residenz, Munich (stucco for the Reichen Zimmer)
- 1733 Pozia Palace, Munich (including the Salon)
- 1734–39 Amalienburg Pavilion, Nymphenburg, Munich (stuccowork)
- 1736–37 Holnstein Palace, Munich (former Erzbischöfliches Palace)
- 1753 Altes Residenztheater, Munich (fresco)
- 1755–57 Nymphenburg, Munich (fresco and stuccowork, Steinerne Saal)

Zuber et Cie.

French wallpaper manufacturers; established 1790

The wallpaper manufacturer Zuber et Cie. has distinguished itself for over two centuries by the quality of its output and, throughout the 19th century, by its exceptional technical innovations. Founded in 1790 in Mulhouse, the factory is also the oldest wallpaper manufacturer still in operation. Its archive collection is unique in terms of its size and quality, and belongs to the Rixheim wallpaper museum, the Musée du Papier Peint de Rixheim.

It was not by chance that the Zuber factory was created in Mulhouse; from 1746 the town had become one of the leading centres for calico printing in France. The company was founded under the name of Nicolas Dollfus & Cie. Two men developed the first small workshop in Mulhouse into a global enterprise: Joseph-Laurent Malaine, flower painter to King Louis XVI at the Gobelins workshop, who right from the start provided the workshop with high quality drawings; and Jean Zuber from Mulhouse, who took control of sales in 1791,

becoming the company's principal shareholder by 1802. Zuber's descendants remained involved with the firm and ensured its continuing reputation up until 1968.

The period during and immediately after the French Revolution was a difficult one, but nevertheless opened up possibilities for the Zuber & Cie. to make large profits. The factory began selling extraordinary drawings of flowers, preserved at Rixheim and at the Bibliothèque Nationale in Paris. When Jean Zuber took full control of the company in 1802 he rationalized it, concentrating in particular on ensuring supplies of the two main materials – paper and pigments – to avoid any break in stocks. To do this he bought a paper mill, where the first ever unbroken roll of paper specially formulated for wallpaper was produced in 1829. The firm's colours were developed in a large kitchen-laboratory (*cuisine de colorants*), which not only supplied the Zuber factory but also other customers, producing Schweinfurt green, Prussian blue, chrome yellow and ultramarine. The quality of the colours of Zuber's 19th-century wallpapers is still considered astonishing today.

The company rapidly became one of the largest in its field in the world. In the mid-19th century it employed around 500 workers and used 80 tables on which to print the designs before mechanisation was introduced. The process involved in producing iridescent effects was perfected in 1819. In 1827 wallpaper was printed from a line-engraved copper cylinder for the first time, thus opening the way for mechanisation by combining unbroken paper with cylinder printing. This technique was perfected in England as early as 1841 with the introduction of surface printing machines; Zuber was the first company to begin using it on the Continent, in 1850.

The technical quality of Zuber's output went hand in hand with the quality of its designs, thanks to the recruitment of remarkably good artists, most from Alsace, from the 1820s on.

Zuber et Cie.: *Eldorado* panoramic wallpaper, 1849

A concern for realistic and sumptuous ornament, and the use of a high degree of naturalism and more intense colours in the flowers, differentiated Zuber's work from that of other manufacturers at the time.

In 1804 Zuber launched its first wallpaper with a panoramic scene, *Les Vues de Suisse*, probably the first polychrome panoramic wallpaper to come on the market. After that, some thirty such scenes came out of the Rixheim workshops up until 1867, among which were *L'Hindoustan* (1807), *Les Vues du Brésil* (1830) and *Les Vues d'Amérique du Nord* (1834). Beginning in 1842, Zuber was the first company to launch panoramic wallpapers containing solely natural scenes, a genre which achieved great success with *Isola Bella* (1842), *Eldorado* (1848) and *Les Zones Terrestres* (1855). While the first panoramic scenes were the work of Paris artists – Pierre-Antoine Mongin (1804–27) and Jean-Julien Deltil (1791–1863) – the later scenes depicting nature in all its exuberance were prepared by Alsace artists – Emile Zipélius (1833–64) and Eugène Ehrmann (1804–96) – who trained in the region and who also worked on floral textile designs.

In the second half of the 19th century and up until World War I, the Zuber factory continued to produce a very high quality range of hand-blocked and embossed wallpapers as well as its relatively high quality machine-printed work. Its inspiration changed little during the course of the 20th century and by the 1960s it seemed that the company was running out of steam. After 1968, therefore, it was decided gradually to phase out the machine printing and to concentrate on block-printing not only the panoramic designs but also traditional designs found in the company's archive. The Musée du Papier Peint was founded on the basis of these archives in 1982, and since then it has been augmented by important collections from a number of other sources. Since 1984 the company has continued manufacturing under the new owners, Chalaye SA of Nice.

Zucchi, Antonio 1726–1796

Italian painter and decorative artist

The name of Antonio Zucchi is closely linked with that of the architect Robert Adam with whom he worked as one of his principal decorative artists. With his contemporaries Michelangelo Pergolesi, Biagio Rebecca and Giambattista Cipriani, Zucchi can also be seen as part of a continuing tradition of foreign – and particularly Italian – artists working in England as decorative painters during the mid-18th century. An earlier generation, whose most prominent members were Louis Chéron, Antonio Verrio, Louis Laguerre and Jacopo Amigoni supplied a demand for painted interior decoration which native artists, with the significant exceptions of Sir James Thornhill and William Kent, could not satisfy. The supposed dearth of native talent was the result of both the inherent assumption by those commissioning the painting that quality could be found only abroad and a lack of organised artistic training in England before the foundation of the Royal Academy in 1768, on the lines of the great art academies of France and Italy.

In the first half of the 18th century artists such as William Hogarth and Francis Hayman attempted to kindle an interest in the production in England of History Painting. This was a genre that represented the summit of the artistic hierarchy and was highly prized because of its reliance on the artist's intellectual prowess and knowledge of classical texts and historical events as well as artistic abilities. Hogarth, with reference to his decorative scheme on the staircase at St. Bartholomew's Hospital, London (executed 1735–37) hoped that "they might serve as a specimen, to shew that were there an inclination in England for encouraging historical pictures, such a first essay might prove the painting of them more easily attainable than is generally imagined" (Croft-Murray, 1970, p.34). It is also important to remember that before the 20th century there was less demarcation between the fine and decorative arts, and although a hierarchy existed within painting, it was neither unusual nor demeaning for prominent portraitists or history painters to be regularly involved in the decoration of pleasure gardens such as at Vauxhall and in scene painting for the theatre or in painting panels for coaches. For example, both the State and Lord Mayor's Coaches are decorated with panels attributed to the Royal Academician Giambattista Cipriani.

During the second half of the 18th century, painted decoration within interiors was often restricted to elements of the interior decoration rather than the entire wall or ceiling (as in the case of Chéron's ceiling paintings in the Egyptian and Great Halls at Boughton), and it was often unnecessary for the artist to paint on site, as the designs were executed on paper which were then applied directly on to the interior surface. Robert Adam, in his *Works in Architecture* argues that the "rage of painting became so prevalent in Italy that instead of following the great examples [i.e. the Renaissance] they covered every ceiling with large fresco compositions which though extremely fine and well painted were very much misplaced, and must necessarily from the attitude in which they must be beheld, tire the patience of every spectator" (Jourdain, 1950, p.71). Certainly for artists such as Zucchi it made good economic sense to become involved with the current fashion in interior design.

Creatively at least, the period of Zucchi's stay in England is his most important. His paintings can be found in Adam's most prestigious commissions, most notably Kenwood House (Hampstead, London), Kedleston Hall (Derbyshire), Home House (20 Portman Square, London) and Osterley Park (Middlesex). His close affiliation with Adam, and by extension the other artists in Adam's employ (Cipriani and Rebecca) led to some confusion both in contemporary minds and since as to the attribution of the painted decoration in Adam's interiors. Daniel Lyson, for example, in his *Environs of London* (1795) describes the paintings in the hall at Kenwood as by Rebecca, possibly because the grisaille technique which Zucchi uses in the ceiling painting was one much favoured by Rebecca. Similarly, the medallions in the Music Room at Harewood, Yorkshire, were attributed to Zucchi soon after completion, then attributed to Rebecca and finally during this century (the recent guidebook included) to Angelica Kauffman (Roworth, 1992, p.120). It can be said that the constant use of fashionable classical texts and allegories as sources for the paintings, the prolific use of designs after Kauffman and, indeed, a superficial similarity of execution, are responsible for this confusion.

Stylistically, Zucchi was an exponent of the new Neo-Classical style and was heavily influenced by Charles-Louis Clérisseau, the artist / draughtsman hired by Adam while he was in Rome and who accompanied him to Split. Given this shared influence, it is not surprising that Adam perceived within Zucchi's design and execution a style that was in sympathy with and complemented precisely his own form of Neo-Classical interior. Certainly Clérisseau's influence on Zucchi was profound, as revealed in particular within the large classical *capricci* (compositions of classical ruins and figures) executed by Zucchi in the eating room at Osterley Park, the Saloon at Nostell Priory, Yorkshire and the Music Room in Harewood. As Clérisseau's biographer writes if "it were not for the fact that the Osterley Park paintings are signed by Zucchi and dated 1767 we would probably attribute them to Clérisseau" (Thomas J. McCormick, *Charles-Louis Clérisseau and the Genesis of Neo-Classicism*, 1990, p.148).

The library at Kenwood House, completed in 1770, is undoubtedly one of Adam's most exquisite interiors, and the painted decoration executed by Zucchi is an integral part of the overall effect. The intention of the painted decoration was neither to detract from the rest of the interior nor indeed to

supply "gap fillers" but to be part of a decorative harmony as important as the plasterwork or gilding. Adam deemed Zucchi's contribution to his interiors a selling point in its own right as is evident in his comment that "The paintings are elegantly performed, by Mr. Antonio Zucchi, a Venetian painter, of great eminence". There are nineteen paintings by Zucchi within this room; the most prominent is the central ceiling oval representing *Hercules Between Glory and the Passions*, a suitable theme of wisdom for a library interior. The Passions are represented by Bacchantes with the attributes of Bacchus himself, the urn and thyrsus. To the right Glory, a female figure in armour, points towards the distant temple of fame. Other panels in the scheme include those representing the Seasons, Religion, Jurisprudence, Mathematics and Philosophy.

The choice of subject matter for interior decorative paintings was often dictated by the purpose of the room, where custom demanded a particular iconography. Charles Saumarez Smith refers to Adam's meticulous use of decoration when he writes "it is clear from the comments on plans that they paid much attention to the use of rooms, and in distinguishing the ornamental character of the rooms according to their function" (Saumarez Smith, 1993, p.220). At Kenwood House the reading of the decorative work in the hallway revealed Adam's original intention of combining the hallway as a dining area. The paintings by Zucchi contain representations of the gods Bacchus, Ceres and Diana (the latter now missing) complementing the Bacchic symbolism which continues in the stuccoed ceiling details and mantelpiece. Images of Diana the huntress were traditionally used in hallways, but Bacchus and Ceres (as seen above) were generally associated with dining areas. The combined purpose of the hallway as both entrance room and dining area was an aspect of architectural interior design that was beginning to die out by the 18th century but, as revealed by Zucchi's paintings, it was a custom that Adam decided to re-introduce (J. Bryant, *The Iveagh Bequest Kenwood House*, 1993, p.6).

Other interior paintings by Zucchi can be seen in Saltram House, Devon – of particular interest are those in the Saloon, painted 1768–70 – the Tapestry Room at Nostell Priory and the library ceiling at Newby Hall, Yorkshire.

JACQUELINE RIDING

See also Kauffman

Biography

Born in Venice, 1 May 1726, into a family of artists; son of the engraver Francesco Zucchi and brother of the engraver Giuseppe Carlo. Studied painting with Francesco Fontebasso, and then with Jacopo Amigoni. Married the artist Angelica Kauffman in London, 1781. Active as an artist in Venice from the 1750s. Undertook several study trips after 1759; accompanied Robert Adam and Charles-Louis Clérisseau to Rome and Naples, 1760. Settled in Rome. Travelled to London at the invitation of Robert Adam, 1766; worked with him on various decorative commissions throughout the late 1760s and 1770s. Returned to Rome with Kauffman, 1781; moved with her to Naples, 1782–85. Member, Accademia di Pittura e Scultura, Venice, 1756; Member, Royal Academy of Arts, London, 1784. Died in Rome, 26 December 1796.
